V

Phase IB Analytical Data

V.1. INTRODUCTION

This revised appendix presents analytical (chemical) data from laboratory analyses performed during Phase IB activities under the RCRA Facility Investigation at the CIBA-GEIGY facility in Cranston, R.I.

The appendix contains final data from two rounds of sampling – Round 1 and Round 2. *Final data* means analytical data which has been (a) validated and (b) moved, electronically, to a new set of data fields using transfer rules. The transfer rules are based upon the data qualifiers, and are presented in Table B-9 (Revisions to the Phase I Interim Report and Phase II Proposal, Appendix B).

All analytical data, detected and undetected, have been selected for presentation. Where analytes were undetected, the detection limits were reported in the concentration field.

V.2. ORGANIZATION OF DATA PRESENTED

The order in which data has been selected for presentation is by area, sub-area, sample type, and round. The main classification is by area. The five areas within the Cranston site, in the order presented, are: Production (PROD), Waste Water Treatment (WWTA), Warwick (WARWK), Off-Site (OFFST), and RIVER (Pawtuxet). In addition to these five geographical areas, the term "LAB' is used as an area to identify trip blanks.

Each area is further classified by sub-area. Sub-areas identify solid waste management units (SMU), areas of concern (AOC), and additional areas of investigation (AOI). Typical sub-areas are: SMU10, AOC13, and AOI16. In the RIVER area, numbers (e.g., "01") are also used to identify sub-areas.

Within each sub-area, samples are identified by type – surficial soil, subsurface soil, groundwater (shallow, deep, and bedrock), surface water, and sediment. Finally within each area, sub-area, and sample type, records are separated by round number.

Note that not all sample types will be found in every sub-area and area.

A schematic diagram of the data organization is –

AREA (#1)

SUB-AREA (#1)

Surficial Soil, Round 1
Surficial Soil, Round 2

Subsurface Soil, Round 1
Subsurface Soil, Round 2

Shallow Groundwater, Round 1
Shallow Groundwater, Round 2

Deep Groundwater, Round 1
Deep Groundwater, Round 2

Bedrock Groundwater, Round 1
Bedrock Groundwater, Round 2

SUB-AREA (#2)

Surficial Soil, Round 1
Surficial Soil, Round 2

.....etc

AREA (#2)

SUB-AREA (#1)

Surface Water, Round 1
Surface Water, Round 2

Sediment, Round 1
Sediment, Round 2

..... etc.

V. 3. FORMAT OF REVISED APPENDIX V TABLES

This section describes the format of the tabulated data. The column headers, and their descriptions are as follows:

AREA	Identifies one of the following areas: PROD – Production Area WWTA – Waste Water Treatment Area WARWK – Warwick Area OFFST – Off-site Area RIVER – Pawtuxet River LAB – used for trip blanks only
SUB-AREA	A sub-division (such as SMU, AOC, or AOI) of the general AREA (see above) where the sample was collected.
MEDIA	The medium of concern from which the sample was collected – soil, groundwater, river (surface) water, pond (surface) water, or sediment (from either the river or the SMU-10 pond).
R	Abbreviation for round number. Values are 1 or 2.
LOC CODE	Abbreviation for location code. Identifies specific locations within a sub-area, such as a grid location (e.g., "A25"), a monitoring well location (e.g., "MW1S"), or a boring location (e.g., "B-8B").
SAMPLE ID	The unique sample identifier. The format of the SAMPLE ID will depend on the sample type. (Appendix B describes sample numbering).
SAMPLE DATE	Date sample was collected.
TEST CODE	Laboratory code which identifies analytical test method.
ANALYTE NAME	Either chemical name (e.g., "ACETONE") or a parameter name (e.g., "TOTAL ORGANIC CARBON").
DQ	Data qualifier for the final data. Appendix B describes the allowed data qualifiers.

VAL STD UOM_3	Term used to identify the value of chemical concentration or parameter value in the final data field. Abbreviation represents the value in the "standard unit of measure field #3 (final data).
STD UOM	Standard unit of measurement for final data.

For Round 2, SAMPLE ID values were identified by an appended "*IB-2" (e.g., B-2C*IB-2). Round 1 samples did not have this specific phase and round identifier appended, and the corresponding SAMPLE ID for this example was B-2C.

Analytes are listed alphabetically within a test code group; analyte names beginning with numbers precede those beginning with letters. For example, 2-butanone precedes acetone. The test code identifies the laboratory method used for analysis; for example code 8080 identifies pesticides, 8240 identifies volatile organics, etc. The column header *TEST CODE,* includes additional characters appended to the test code, for example 8080S identifies a soil sample method
