APPENDIX B
STATISTICAL ANALYSIS USED TO SUPPORT THE BHHRA

(see CD, Enclosed with Hard Copy Transmittal)

APPENDIX B
STATISTICAL ANALYSIS USED TO SUPPORT THE BHHRA

APPENDIX B-1
UTILITY/CONSTRUCTION WORKER EXPOSURE ASSESSMENT – DOSE EQUATIONS

APPENDIX B-1

The equations used for defining exposures to sediment for utility/construction workers are as follows.

Total dose for utility/construction worker.

$Construction\ Worker\ Total\ Dose$ (mg / kg BW day) = Sediment_(CDI − ingest) (mg / kg BW day) + Sediment_(CDI − dermal) (mg / kg BW day) (Equation 1)

For carcinogens, RME incidental sediment exposure.

$$Sediment_{CDI-ingest}\ (mg/kg\ BW day) = \frac{Sediment\left(\frac{mg}{kg}\right)\times\left(\frac{1\ kg}{1{,}000{,}000\ mg}\right)\times EF\left(60\frac{days}{year}\right)\times ED\ (12.5\ years)\times\ IR\left(\frac{100\ mg}{day}\right)}{AT_{cw}\left(\frac{365\ days}{year}\times LT\ (70\ years)\right)\times BW\ (70\ kg)}$$

(Equation 2)

For carcinogens, RME dermal sediment exposure.

$$Sediment\ CDI\text{-}dermal(mg/kg\ BW day) = \frac{Sediment\left(\frac{mg}{kg}\right)\times\left(\frac{1\ kg}{1{,}000{,}000\ mg}\right)\times EF\ \left(60\frac{days}{year}\right)\times ED\ (12.5\ years)\times SA\left(\frac{402\ cm^2}{day}\right)\times AF\left(\frac{0.071\ mg}{cm^2}\right)\times ABS_d}{AT_{cw}\left(\frac{365\ days}{year}\times LT\ (70\ years)\right)\times BW\ (70\ kg)}$$

(Equation 3)

For carcinogens, CTE incidental sediment exposure.

$$Sediment_{CDI-ingest}\ (mg/kg\ BWday) = \frac{Sediment\left(\frac{mg}{kg}\right)\times\left(\frac{1\ kg}{1{,}000{,}000\ mg}\right)\times EF\left(10\frac{days}{year}\right)\times ED\ (9\ years)\times\ IR\left(\frac{50\ mg}{day}\right)}{AT_{cw}\left(\frac{365\ days}{year}\times LT\ (70\ years)\right)\times BW\ (70\ kg)} \quad \text{(Equation 4)}$$

For carcinogens, CTE dermal sediment exposure.

$$Sediment_{CDI\text{-}dermal}\ (mg/kg\ BWday) = \frac{Sediment\left(\frac{mg}{kg}\right)\times\left(\frac{1\ kg}{1{,}000{,}000\ mg}\right)\times EF\left(10\frac{days}{year}\right)\times ED\ (9\ years)\times SA\left(\frac{402\ cm^2}{day}\right)\times AF\left(\frac{0.071\ mg}{cm^2}\right)\times ABS_d}{AT_{cw}\left(\frac{365\ days}{year}\times LT\ (70\ years)\right)\times BW\ (70\ kg)}$$

(Equation 5)

The following equations are for non-carcinogenic exposures.

For non-carcinogens, RME incidental sediment exposure.

$$Sediment_{CDI-ingest}\ (mg/kg\ BWday) = \frac{Sediment\left(\frac{mg}{kg}\right)\times\left(\frac{1\ \mathrm{kg}}{1{,}000{,}000\ \mathrm{mg}}\right)\times \mathrm{EF}\left(60\frac{\mathrm{days}}{\mathrm{year}}\right)\times \mathrm{ED}\ (12.5\ \mathrm{years})\times\ IR\left(\frac{100\ \mathrm{mg}}{\mathrm{day}}\right)}{\mathrm{AT_{NC}}\left(\frac{365\ \mathrm{days}}{\mathrm{year}}\times \mathrm{ED}\ (12.5\ \mathrm{years})\right)\times \mathrm{BW}\ (70\ \mathrm{kg})} \quad \text{(Equation 6)}$$

For non-carcinogens, RME dermal exposure.

$$Sediment_{CDI-dermal}(mg/kgBW\ day) = \frac{Sediment\left(\frac{mg}{kg}\right)\times\left(\frac{1\text{ kg}}{1{,}000{,}000\text{ mg}}\right)\times \text{EF}\left(60\frac{\text{days}}{\text{year}}\right)\times \text{ED (12.5 years)} \times \text{SA}\left(\frac{402\text{ cm}^2}{\text{day}}\right)\times \text{AF}\left(\frac{0.071\text{ mg}}{\text{cm}^2}\right)\text{x ABS}_\text{d}}{\text{AT}_\text{NC}\left(\frac{365\text{ days}}{\text{year}}\times \text{ED (12.5 years)}\right)\times \text{BW (70 kg)}}$$

(Equation 7)

For non-carcinogens, CTE incidental sediment exposure.

$$Sediment_{CDI-ingest}\ (mg/kg\ BWday) = \frac{Sediment\left(\frac{mg}{kg}\right)\times\left(\frac{1\text{ kg}}{1{,}000{,}000\text{ mg}}\right)\times \text{EF}\left(10\frac{\text{days}}{\text{year}}\right)\times \text{ED (9 years)} \times IR\left(\frac{50\text{ mg}}{\text{day}}\right)}{\text{AT}_\text{NC}\left(\frac{365\text{ days}}{\text{year}}\text{x ED (9 years)}\right)\times \text{BW (70 kg)}}$$

(Equation 8)

For non-carcinogens, CTE dermal exposure.

$$Sediment_{CDI-dermal}(mg/kgBW\ day) = \frac{Sediment\left(\frac{mg}{kg}\right)\times\left(\frac{1\text{ kg}}{1{,}000{,}000\text{ mg}}\right)\times \text{EF}\left(10\frac{\text{days}}{\text{year}}\right)\times \text{ED (9 years)} \times \text{SA}\left(\frac{402\text{ cm}^2}{\text{day}}\right)\times \text{AF}\left(\frac{0.071\text{ mg}}{\text{cm}^2}\right)\times \text{ABS}_\text{d}}{\text{AT}_\text{NC}\left(\frac{365\text{ days}}{\text{year}}\times \text{ED (9 years)}\right)\times \text{BW (70 kg)}}$$

(Equation 9)

where:

EPC	=	Exposure point concentration (sediment mg/kg dw)
BW	=	Body weight (kg)
EF	=	Exposure frequency (days/years)
ED	=	Exposure duration (years)

IR-S	=	Sediment ingestion rate (mg/day)
AT-cw	=	Averaging time, cancer (days) (AT days/year x LT years)
AT-nc	=	Averaging time, non-cancer (days) (AT days/year x ED years)
LT	=	Lifetime (years)
SA	=	Skin surface area (cm^2 day)
AF	=	Adherence factor (mg/cm^2)
ABSd	=	Absorption factor (dermal)

APPENDIX B-3
DISCRIMINANT ANALYSIS

1 DISCRIMINANT ANALYSIS

This section of Appendix B provides the details and results of the discriminant analysis presented in Section 5.

1.1 Discriminant Analysis Approach

Discriminant analysis was performed as a quantitative evaluation of results from an initial graphical analysis of PCB and dioxin/furan congener patterns in fish/shellfish tissues from the Houston Ship Channel (HSC) and Patrick Bayou (see Section 5).

Discriminant analysis was used to identify differences and similarities between locations based on a specific set of parameters. The locations are the different zones in the HSC and Patrick Bayou (see Figure 5-1 of this report). The parameters are the PCB and dioxin/furan congeners (the COPCs) analyzed in blue crabs and hardhead catfish. With discriminant analysis, a statistical test is conducted to assess the probability that any one station (or multiple samples from a station over time) from a particular zone is more similar to stations from a different zone, and therefore, whether the data should be considered part of the same dataset for the purposes of assessing exposure of fish and shellfish to sources of PCBs and dioxins/furans in the HSC and Patrick Bayou. A discriminant analysis can also be used to statistically evaluate the importance of parameters used to describe the zones.

Discriminant analysis was performed using SPSS, Release 18.0 (SPSS 2009). The test of probabilities for station/sample specific zone membership is presented with the case wise statistics table in each of the SPSS outputs presented in Appendices B-3a to B-3d. This output gives the actual, or "original" zone location for a sample and the zone membership for that sample as predicted by the discriminant analysis model. While for the most part, a station/sample is predicted to be part of its original zone, in some instances, an alternate zone is predicted. For example, for PCBs as ratios of PCB congeners to total PCBs (the 18 PCB congeners described in Section 5.3.3) in hardhead catfish (Appendix B-3b), the predicted zone membership for a station (Case 26) from Zone 2 is that it is a member of Zone 1 and the probability of that new group membership is 0.79 (column = P(G=g | D=d)). The “Squared Mahalanobis Distance to Centroid” is also presented in the case wise statistic results; the

centroid is the relative distance of the station to the predicted zone centroid. For Case 26 described above, the Squared Mahalanobis Distance to Centroid is 11.64.

The results of the case wise statistics are summarized in the classification results table in the SPSS output for each evaluation. With this summary, the number of samples/stations that actually belong to a zone and are classified correctly are presented, as well as, those predicted to be a member of a different zone. For example, for PCBs as ratios of PCB congeners to total PCBs in hardhead catfish (Appendix B-3b), the predicted zone membership for all nine stations from Zone 3 are that they all are members of Zone 3. It is noted that none of the samples/stations from Zone 3 are predicted to part of the Patrick Bayou (Zone 7) dataset.

The Canonical Discriminant Function scatter plot graphically presents membership of samples/stations within the "original" or alternate zones. This scatter plot is based on the results presented in the case wise statistics table, which includes the distance to centroid data, and the discriminant scores for each of the six functions evaluated in the discriminant model.

Discriminant analysis can also be used to statistically evaluate the importance of parameters used to describe the zones. The statistical test of the parameters is performed in part, using the covariance matrix that contains each of the parameters used in the discriminant model. The relative importance of each parameter to each discriminant function is further defined with the structure matrix. A summary of the most important PCB congeners that describe the discriminant functions is presented in Table B3-1. For example, for PCBs as ratios of PCB congeners to total PCBs in blue crab (Table B3-1 and Appendix B-3a), the most important PCB congeners that describe the first discriminant function (Function 1) are PCB-061/070/074/076 (0.761[1]) and PCB-129/138/163 (-0.514). Furthermore, for PCBs as ratios of PCB congeners to total PCBs in hardhead catfish (Table B3-1 and Appendix B-3b), the most important PCB congeners that describe the first discriminant function (Function 1) are PCB-066 (0.298) and PCB-153/168 (-0.184). A positive and negative relative importance for each function defines how different these two congeners are for this function and are relevant to describing the Canonical Discriminant Function scatter plot. The magnitude of the pooled

[1] This value (positive or negative) is the pooled within groups correlation between discriminating variables and standardized canonical discriminant functions (pooled within groups correlation).

within groups correlation also demonstrates how well, relative to the other congeners, the PCB congeners and dioxin/furan congeners describe the Canonical Discriminant Function scatter plot. For the PCB congeners, the PCB congeners with a positive relative importance were also the PCB congeners that differentiate Patrick Bayou from HSC.

For dioxin/furans as ratios of dioxin/furans congeners to total dioxin/furans in blue crab (see Table B3-1 and Appendix B-3c) the most important dioxin/furan congeners that describe the first discriminant function (Function 1) are 1,2,3,7,8-PeCDF (0.648) and 1,2,3,6,7,8-HxCDD (-0.321). Furthermore, for dioxin/furans as ratios of dioxin/furans congeners to total dioxin/furans in hardhead catfish, the most important dioxin/furan congeners that describe the first discriminant function (Function 1) are 1,2,3,6,7,8-HxCDD (0.343) and 2,3,4,7,8-PeCDF (-0.613) (see Table B3-1 and Appendix B-3d). The dioxin/furan congener with a positive relative importance for blue crab was the important congener that differentiates Patrick Bayou from HSC. Conversely, the dioxin/furan congener with a negative relative importance for hardhead catfish was the important congener that differentiates Patrick Bayou from HSC.

Pooled within-groups correlations between discriminating variables and standardized canonical discriminant functions
Variables ordered by absolute size of correlation within function.

*. Largest absolute correlation between each variable and any discriminant function

Notes

Missing Value Handling	Definition of Missing	User-defined missing values are treated as missing in the analysis phase.
	Cases Used	In the analysis phase, cases with no user- or system-missing values for any predictor variable are used. Cases with user-, system-missing, or out-of-range values for the grouping variable are always excluded.

a. The group covariance matrix for group 5 cannot be computed because there is insufficient data.

b. The group covariance matrix for group 6 cannot be computed because there is insufficient data.

c. The total covariance matrix has 55 degrees of freedom.

a. The group covariance matrix for group 5 cannot be computed because there is insufficient data.

b. The group covariance matrix for group 6 cannot be computed because there is insufficient data.

c. The total covariance matrix has 55 degrees of freedom.

Pooled within-groups correlations between discriminating variables and standardized canonical discriminant functions
Variables ordered by absolute size of correlation within function.

*. Largest absolute correlation between each variable and any discriminant function

Missing Value Handling	Definition of Missing	User-defined missing values are treated as missing in the analysis phase.
	Cases Used	In the analysis phase, cases with no user- or system-missing values for any predictor variable are used. Cases with user-, system-missing, or out-of-range values for the grouping variable are always excluded.

	Dis7_2	Probabilities of Membership in Group 7 for Analysis 1
Number of unweighted cases written to the working file after classification		77

[DataSet14] C:\Patrick Bayou\BHHRA 2012\WP Text\Text\First Version\Appendix\Appendix B Exposure Supporting Files\Discriminant Analysis\Base\PCB SPSS\PB_HSC_PCB_HHC_BCC_ROS_CleanBase.sav

Analysis Case Processing Summary

Unweighted Cases		N	Percent
Valid		56	72.7
Excluded	Missing or out-of-range group codes	0	.0
	At least one missing discriminating variable	21	27.3
	Both missing or out-of-range group codes and at least one missing discriminating variable	0	.0
	Total	21	27.3
Total		77	100.0

a. The group covariance matrix for group 5 cannot be computed because there is insufficient data.

b. The group covariance matrix for group 6 cannot be computed because there is insufficient data.

c. The total covariance matrix has 55 degrees of freedom.

a. The group covariance matrix for group 5 cannot be computed because there is insufficient data.

b. The group covariance matrix for group 6 cannot be computed because there is insufficient data.

c. The total covariance matrix has 55 degrees of freedom.

a. The group covariance matrix for group 5 cannot be computed because there is insufficient data.

b. The group covariance matrix for group 6 cannot be computed because there is insufficient data.

c. The total covariance matrix has 55 degrees of freedom.

Pooled within-groups correlations between discriminating variables and standardized canonical discriminant functions
Variables ordered by absolute size of correlation within function.

*. Largest absolute correlation between each variable and any discriminant function

Missing Value Handling	Definition of Missing	User-defined missing values are treated as missing in the analysis phase.
	Cases Used	In the analysis phase, cases with no user- or system-missing values for any predictor variable are used. Cases with user-, system-missing, or out-of-range values for the grouping variable are always excluded.

Analysis 1

Variables Failing Tolerance Test[a]

	Within-Groups Variance	Tolerance	Minimum Tolerance
2,3,7,8-TCDD/Total	.006	.000	.000

All variables passing the tolerance criteria are entered simultaneously.

a. Minimum tolerance level is .001.

Summary of Canonical Discriminant Functions

Eigenvalues

Function	Eigenvalue	% of Variance	Cumulative %	Canonical Correlation
1	2.146[a]	67.4	67.4	.826
2	.432[a]	13.6	81.0	.549
3	.245[a]	7.7	88.7	.443
4	.205[a]	6.4	95.1	.412
5	.105[a]	3.3	98.4	.308
6	.051[a]	1.6	100.0	.220

a. First 6 canonical discriminant functions were used in the analysis.

Wilks' Lambda

Test of Function(s)	Wilks' Lambda	Chi-square	df	Sig.

Pooled within-groups correlations between discriminating variables and standardized canonical discriminant functions
Variables ordered by absolute size of correlation within function.

*. Largest absolute correlation between each variable and any discriminant function

a. This variable not used in the analysis.

Missing Value Handling	Definition of Missing	User-defined missing values are treated as missing in the analysis phase.
	Cases Used	In the analysis phase, cases with no user- or system-missing values for any predictor variable are used. Cases with user-, system-missing, or out-of-range values for the grouping variable are always excluded.

Analysis 1

Variables Failing Tolerance Test[a]

	Within-Groups Variance	Tolerance	Minimum Tolerance
2,3,7,8-TCDD/Total	.018	.000	.000

All variables passing the tolerance criteria are entered simultaneously.

a. Minimum tolerance level is .001.

Summary of Canonical Discriminant Functions

Eigenvalues

Function	Eigenvalue	% of Variance	Cumulative %	Canonical Correlation
1	3.906[a]	74.0	74.0	.892
2	1.021[a]	19.3	93.4	.711
3	.191[a]	3.6	97.0	.401
4	.086[a]	1.6	98.6	.282
5	.059[a]	1.1	99.7	.237
6	.014[a]	.3	100.0	.116

a. First 6 canonical discriminant functions were used in the analysis.

Wilks' Lambda

Pooled within-groups correlations between discriminating variables and standardized canonical discriminant functions
Variables ordered by absolute size of correlation within function.

*. Largest absolute correlation between each variable and any discriminant function

a. This variable not used in the analysis.

COMMENTS AND RESPONSES MATRIX FOR TCEQ AND USEPA - PATRICK BAYOU DRAFT HUMAN HEALTH RISK ASSESSMENT

Comments and Responses Matrix for TCEQ and USEPA- Patrick Bayou Draft Human Health Risk Assessment

Comment No.	Section	Page	Line	Agency/Comment	Response to Comment - Proposed Revision
1	Executive Summary			TCEQ/ Public health assessments conducted by the Texas Department of State Health Services (formerly TDH) are irrelevant to the appropriate evaluation of sites under TCEQ rules (e.g., TRRP) and guidance.	Comment is noted. No revisions to text are requested. To clarify, the Public Health Assessment conducted by the Texas Department of Health Services (formally Texas Department of Health) was required under CERCLA (TDH 2003) which is why the report is referenced in the BHHRA. TDH, 2003. Texas Department of Health, Public Health Assessment Patrick Bayou Deer Park, Harris County, Texas. February 2003.
2	Table 5-1 and 5-2			TCEQ/ While TD [Toxicology Division] notes that the individual-chemical and cumulative risks/hazards calculated for the receptors evaluated in the draft BHHRA are acceptable under TRRP, 60 days per year was not used as the exposure frequency for the construction worker per the May 2011 responses to comments (e.g., 20 days per year was used for the RME in Table 5-1). However, review of the risk/hazard results (e.g., Table 7-1 and 7-3 RME results) indicates that the conclusions of the draft BHHRA for this receptor would not change.	A 20 days/year exposure frequency is a more appropriate and likely more accurate assumption for the construction/utility worker reasonable maximum exposure scenario. However, the exposure frequency will be changed to 60 days/year from 20 days/year for the construction/utility worker reasonable maximum exposure scenarios as previously agreed in the response to comments on the BHHRA Work Plan[1]. A revised evaluation of risk for the construction/utility worker under the reasonable maximum exposure scenarios will be conducted. We agree with the reviewer that this change will not alter the risk conclusions for this receptor.
3	Table 5-4			TCEQ/ Although TD notes that some of the sediment exposure point concentrations in Table 5-4 exceed TRRP sediment PCLs for recreational receptors (e.g., total PCBs exceed the sediment PCL of 2.3 mg/kg, total cPAH as compared to the BaP sediment PCL of 1.6 mg/kg), USEPA indicates that access is restricted such that regular recreational/trespasser exposure to sediment and surface water is highly unlikely. More specifically, the draft BHHRA indicates, "the entire shoreline of the Patrick Bayou Site is lined by three major industrial properties: Lubrizol, OxyVinyls, and Shell. For safety reasons, the industries located along the shoreline of Patrick Bayou restrict public access 24 hours a day, 7 days a week, and require escorts while on-Site. There are also several above ground industrial pipelines and a bridge crossing the bayou near the north entrance at the Houston Ship Channel (HSC) that effectively restrict access by boat...In addition, security controls are in place that restricts public access to the HSC and the Site by boat...The Captain of the Port of Houston-Galveston has established security zones for certain areas within the Houston-Galveston area, which includes the portion of the HSC where Patrick Bayou enters. The security zones exclude recreational/unauthorized vessels from this area on a round-the-clock basis...Because, public access to the shoreline is restricted by the bordering industrial facilities the potential for exposure to Site contaminants in the sediment is low...there is little or no potential for humans to be exposed to any contaminants which might be in the surface water...access to Patrick Bayou is not possible for purposes of recreational activities." Additionally, Patrick's Bayou (and the HSC) does not appear to be designated for contact recreation use in 30 TAC §307.10 (Appendix A).	Comment is noted. The USEPA approved BHHRA Work Plan did not identify complete exposure pathways for recreational or trespasser exposure scenarios, for the reasons quoted by the reviewer.
4	Conceptual Site Model			TCEQ/ Although the May 2011 responses to comments indicated that a groundwater report on upgradient areas outside the Site boundary was in progress that would be used to modify the BHHRA as appropriate, no mention is made in the draft BHHRA.	The groundwater characterization work that has been performed by OxyVinyls, Shell, and Lubrizol under State programs all show that shallow and deep groundwater underlying the facilities flow towards Patrick Bayou. Therefore, porewater within the sediments of the bayou cannot flow upgradient and contaminate areas where potential groundwater wells could be completed. On the basis of this finding, the present physical Conceptual Site Model indicates that Patrick Bayou is not a source to groundwater. The results of the groundwater characterization program will be presented in the Remedial Investigation Report for the Site.
5	Off-Site Recreational Fishermen			TCEQ/ TD has concerns about the ability to evaluate the contribution of Patrick's Bayou contaminants to recreational-sized fish caught 1.6 miles	Summary statistics on dioxin/furan and PCB concentrations in hardhead catfish and blue crabs are presented in Attachment 1 to the Draft BHHRA Report.

[1] Anchor QEA, 2011. Patrick Bayou Superfund Site Baseline Human Health Risk Assessment Work Plan (see Appendix B).

Comment No.	Section	Page	Line	Agency/Comment	Response to Comment - Proposed Revision
	Exposure			off-Site (e.g., at San Jacinto Monument Park) and the associated uncertainty. The draft BHHRA found no observable incremental contribution of D/Fs or PCBs to tissue concentrations at San Jacinto Monument Park, thus no risk characterization was performed in the draft BHHRA for fish/shellfish ingestion. Appendix A-2 of the draft BHHRA contains fish/shellfish tissue data for Patrick's Bayou. Although no summary statistics are provided in the draft BHHRA and the tables in Appendix A-2 are difficult to read as chemical names are only shown on the first few pages, fish tissue concentrations calculated to be protective of human health through consumption under TRRP-24 (e.g., dioxin fish tissue RBEL) appear to be exceeded by the D/F and/or PCB TEQ for all samples (some apparently > 100-fold higher). Thus, while Patrick Bayou contributions to fish at San Jacinto Monument Park over a mile away may not be discernible as evaluated in the draft BHHRA, based on Site-specific tissue data any fish/shellfish from the Site caught by a recreational fisher at another location are likely to have tissue concentrations exceeding the fish tissue RBEL under TRRP.	Please see the integrated response to this comment (and comments 1 and 2 from USEPA) at the end of this response matrix.
6	Table 6-1			TCEQ/ Although this table indicates the new USEPA RfD for dioxins was used, Section 6.4 indicates that the ATSDR chronic oral minimal risk level was used.	The text in section 6.4 will be edited to clarify that the new USEPA oral RfD for 2,3,7,8-TCDD was used in the BHHRA.
7	Table 5-3, 7-1, and 7-2			TCEQ/ These tables of the draft BHHRA contain a dermal absorption factor of 0.03 for the PBC TEQ, which is inconsistent with the previous response to comments on the Work Plan. However, it does not appear that using a value of 0.14 would change the conclusions of the draft BHHRA.	A review of the comments and responses on the BHHRA Work Plan indicate that this issue may not have been fully resolved prior to the Draft BHHRA Report. It was not clear that it was our intent to use 0.03 as the dermal absorption factor (DAF) for dioxin-like PCB congeners. The open literature on this issue (DAF for dioxin-like PCB congeners) does not provide a clear technical basis for selection of a DAF. USEPA (2004) provides a DAF for 1) Aroclors (mixtures of PCB congeners) and 2) TCDD and other PCDD/PCDFs. It does not provide a DAF specifically for dioxin-like PCB congeners. ATSDR (2000) cites studies using rats where the dermal absorption of PCB-77 (a dioxin-like PCB congener) and PCB-153 was evaluated by applying the PCBs to bare skin as either a solid, aqueous paste, aqueous suspension, or dissolved in ethanol. After 24-hrs of dermal exposure, the percentage of the dose absorbed ranged from 6 to 8% for PCB-77 and from 5 to 8% for PCB-153. For this study, there is uncertainty with respect to human absorption of PCBs verses absorption by rats and whether PCBs applied as a solid, as used in the study, would be similar to soil. These studies suggest a DAF in the range from 0.03 to 0.14 would be an appropriate choice for human skin exposed to dioxin-like PCB congeners in soil. In this instance, to maintain a conservative approach for the risk assessment in the face of this uncertainty, the JDG agrees to use the same absorption factor, 0.14 for dioxin-like PCB congeners to assess dermal risk associated with PCB TEQs, as was assumed for total PCB congeners. A revised evaluation of risk for the construction/utility worker, under reasonable maximum and central tendency exposure scenarios will be conducted. ATSDR, 2000. Toxicological Profile for Polychlorinated Biphenyls (PCBs). U.S. Department Of Health and Human Services, Public Health Service, Agency for Toxic Substances and Disease Registry. November 2000. USEPA, 2004. Risk Assessment Guidance for Superfund, Volume 1, Human Health Evaluation Manual (Part E, Supplemental Guidance for Dermal Risk Assessment), Final. Office of Emergency and Remedial Response. USEPA/540/R/99/005. July 2004.
8	Surface Water Exposure for Utility/ Construction Worker			TCEQ/ This section indicates that the brackish nature of the water results in a lack of incidental ingestion of surface water. However, as incidental ingestion is not intentional, this is not necessarily the case.	Comment noted. While incidental ingestion may occur, in our professional judgment it is not expected to result in significant exposure and was therefore identified as complete but minor pathway in the USEPA approved BHHRA Work Plan. Such pathways were not quantitatively evaluated per the Work Plan.

Comments and Responses Matrix for TCEQ and USEPA- Patrick Bayou Draft Human Health Risk Assessment

Comment No.	Section	Page	Line	Agency/Comment	Response to Comment - Proposed Revision
1	Section 8.1 Exposure Assessment:	35		USEPA/Section 8.1 Exposure Assessment The institutional controls restricting fishing in Patrick Bayou and in the HSC is an uncertainty in the exposure assessment. The assumption that the San Jacinto Battleground State Historic Site is the closest receptor for harvesting fish and blue crabs is an uncertainty.	Please see the integrated response to this comment and comment 5 from TCEQ and comment 2 from USEPA.
2	Section 9.2 Off-Site Recreational Fisherman:	39		USEPA/ Section 9.2 Off-Site Recreational Fisherman The risk assessment should mention that if the institutional controls restricting fishing in Patrick Bayou and in the HSC did not exist, the fish caught in these areas would present an unacceptable risk due to fish consumption. The negligible risk to the off-Site recreational fisherman is due to absence of anglers in Patrick Bayou and the HSC, and is not due to the absence of contamination in the fish.	Please see the integrated response to this comment and comment 5 from TCEQ and comment 1 from USEPA.
Integrated comment No. 5 from TCEQ and comments 1 and 2 from USEPA	Off-Site and On-Site Recreational Fishermen Exposure			TCEQ (comment 5) and USEPA (comments 1 and 2) comments on off-Site recreational fishermen exposure.	Integrated response to TCEQ comment 5 and USEPA comments 1 and 2. Currently, it is certain that institutional controls are in place and are effectively controlling access by fishermen to the Site and the adjoining section of the HSC within the USCG Security Zone. As a result, the nearest point of exposure is the San Jacinto Battleground State Historic Site as stated in the BHHRA Work Plan. For the HSC, within the USCG Security Zone, there is currently no indication that unrestricted access to this portion of the HSC will be allowed in the foreseeable future. The on-Site institutional controls are currently maintained by members of the Joint Defense Group and prevent unauthorized access to the Site by fishermen or other trespassers. Given the length of time these facilities have been operating and the designated land use surrounding the Site (i.e., industrial) there is no reason to believe that future conditions would permit access by recreational fishermen. Thus, this exposure pathway is fully expected to remain incomplete into the foreseeable future. Nonetheless, if the institutional controls at the Site and the HSC were not in place, a complete exposure pathway for exposure to COPC via consumption of fish from the Site could exist and potential risks associated with this pathway may no longer be negligible. This will be acknowledged in the BHHRA.

1 INTRODUCTION AND PURPOSE

This data report summarizes the results of the tissue collection activities conducted during the implementation of the *Fish and Invertebrate Tissue Sampling and Analysis Plan, Baseline Human Health Risk Assessment* (SAP; BHHRA; Anchor QEA 2011). This work was performed as part of the *Remedial Investigation/Feasibility Study* (RI/FS) being conducted by the Patrick Bayou Joint Defense Group (JDG) in response to an Administrative Order on Consent (AOC) and Settlement Agreement with the U.S. Environmental Protection Agency (USEPA), dated January 31, 2006. The primary focus of the SAP was to support completion of the BHHRA for the Patrick Bayou Superfund Site (Site).

1.1 Site Description

Patrick Bayou is a tidally influenced tributary of the Houston Ship Channel (HSC) in Harris County, Texas (Figure 1). The Site originates south of State Highway (SH) 225 in the City of Deer Park, Texas, and flows approximately 2.5 miles in a northerly direction, discharging into the south side of the HSC approximately 2.3 miles upstream of its confluence with the San Jacinto River. From the south side of SH 225, the bayou is contained in box culverts, which emerge into a gunite-lined channel approximately 0.3 miles downstream. The gunite-lined portion of the bayou extends approximately 0.45 miles downstream to a more natural channel bottom that makes up the remainder of the Site. A tributary of Patrick Bayou, referred to as the East Fork, joins the bayou approximately 1.4 miles downstream of SH 225.

Patrick Bayou has historically been utilized for residential, municipal and industrial stormwater, and wastewater discharge. Its urbanized/industrial nature is evident from many of the physical modifications to the channel, banks, and surrounding topography. The most obvious physical modifications are the box culvert and gunite channel in the upstream portion of the bayou. Downstream of these modifications, bulkheads and riprap revetments armor some stream banks. The stream bank heights in areas with bulkhead and riprap are generally steep. Areas without bank modifications, which include much of the middle section of the bayou, typically have low, sloping banks. Bank cover in areas without riprap or bulkheads is generally mowed grass with some low shrubs and bare earth. In many areas impervious surfaces, such as parking lots and roads, are located adjacent to the bank of Patrick Bayou. A detailed description of the Site and its physical features is provided in the

Preliminary Site Characterization Report (PSCR; Anchor 2006), and the *Work Package 2 Hydrodynamic Field Data Collection and Contaminant Source Evaluation Data Report* (Anchor 2007).

1.2 Sampling Objectives

The primary focus of this investigation was to collect sufficient tissue chemistry data for fish and blue crab bioaccumulative chemicals of potential concern (COPCs) from the Site to support exposure assessment for the Site's subpopulations of concern, recreational fishermen, and their families, at the point of exposure (POE). The POE is assumed to be the San Jacinto Monument Park area of the HSC, approximately 7,500 feet downstream of Patrick Bayou. Specifically, the SAP addressed the need for additional Site data specific to Patrick Bayou to supplement data collected by Texas Department of State Health Services (TDSHS) and Texas Commission on Environmental Quality (TCEQ). The objectives included collecting sufficient tissue data for comparison to existing tissue data for fish and shellfish collected at the POE. The fish and shellfish tissue data collected from Patrick Bayou were used to evaluate whether the Site is a potentially important incremental source of COPCs to fish and shellfish tissue at the POE. Additionally, tissue collection could allow for the development of site-specific biota-sediment accumulation factors (BSAFs), which is the ratio of COPC concentration in tissue to the concentration in sediment. Development of site-specific BSAFs can be used to estimate the risk-based effectiveness of different remedial options for the Site. Finally, baseline COPC concentrations in biota important for recreational fishermen at the (POE) will provide a point of comparison for long-term (post-remediation) monitoring data, if required, as part of the remedy selection. The baseline data and long-term monitoring data may be necessary to evaluate the performance of implemented remedial actions in meeting risk reduction goals.

The specific objectives of this investigation were to:

- Collect sufficient data to support exposure assessments in the BHHRA.
- Collect sufficient data to develop site-specific BSAFs for modeling future conditions and remedial scenarios.
- Establish baseline tissue concentrations of COPCs to provide a point of comparison for long-term (post-remediation) monitoring data.

2 TISSUE COLLECTION AND PROCESSING

This section describes the methods used to collect and process fish and invertebrate tissue samples at the Site. Additional details regarding collection methods are presented in the SAP. A summary of all fish and invertebrate tissue samples and analyses is provided in Table 1. Copies of field notes (water quality forms), tissue sample collection forms (fish/invertebrate tissue collection run sheets) and sample processing forms (fish/invertebrate tissue collection weights/measures data sheets) are provided in Appendix A. Completed chain-of-custody forms are provided in Appendix B.

2.1 Sample Identification Scheme

Each tissue sample was assigned a unique alphanumeric identifier using the format described below:

- Each location was identified by "PB" to depict the project location (Patrick Bayou), and a number, 01 through 03, identifying the reach (e.g., PB01 for the mouth of Patrick Bayou). A complete description of how the bayou was divided into reaches is provided in the SAP.
- Individual organisms to comprise each sample were identified by the same alphanumeric identifier used to identify the location followed by a three digit species identifier (e.g., "BCR" for blue crab).
- If a field duplicate was collected, a '-D' was appended to the end of the parent sample identifier to indicate it was a duplicate sample.
- Individual organisms that comprise one sample were frozen together in one package. Identifiers for each package were numbered using the following approach:

PB##-X-C-ZZZ-W-###-YYYYMMDD

where:

PB##	=	Patrick Bayou sample reach (## = 01, 02, 03)
X	=	I or F (Invertebrate or Fish, respectively)
C	=	Size class
ZZZ	=	Species code
W	=	Sample type (E – edible tissue, R – remainder)
###	=	Sequential sample number (001, 002, 003,…,999)

YYYYMMDD = Year, month, day sample was collected

In some instances, individual samples were composited together to meet minimum tissue requirements for laboratory analyses. In these cases, the composite sample was given a new name, following the nomenclature below:

PB##-X-Y-ZZZ-W-###-COMP-YYYYMM

where:

PB##	=	Patrick Bayou sample reach (## = 01, 02, 03)
X	=	I or F (Invertebrate or Fish, respectively)
Y	=	Size class (C)
ZZZ	=	Species code
W	=	Sample type (E – edible tissue, R – remainder)
###	=	Sequential composite sample number (001, 002, 003,…,999)
COMP	=	Composite sample
YYYYMM	=	Year and month that samples within the composite were collected

2.2 Sample Locations

To ensure that organisms were collected from the entire length of the Site, Patrick Bayou was divided into three reaches (the gunite channel section of the bayou was excluded from this sampling event). A complete description of how this was done is provided in the SAP. The hardhead catfish and blue crabs were collected from stations located within the three reaches. Fish collected from a certain reach was not a requirement, as the fish were expected to migrate throughout the entire bayou. However, an attempt was made to collect blue crabs from each reach and as evenly across reaches as possible. Due to the more sedentary lifestyle of the blue crabs, it was important to collect tissue samples more evenly across the entire Site.

Two methodologies were utilized to collect samples. For blue crabs, sample locations were selected randomly from among the set of sediment sample locations previously sampled as part of the sediment and surface water COPC delineation effort (Anchor QEA 2010). Five randomly selected stations were sampled for blue crab in each of Reaches 1, 2, and 3.

Samples were collected within a 15-meter radius of the designated coordinates. For the fish, sample locations were not co-located with sediment samples. Collection efforts were performed on a reach-wide basis (i.e., sampling locations were selected opportunistically based on Site conditions such as substrate and water depth). However, an attempt was made to collect individuals from each reach. Locations of all sampling gear were recorded using a differential global positioning system (DGPS).

2.3 Sample Collection Methods

Blue crabs were collected using a combination of crab traps and crab nets over a period of two weeks. Gear was deployed from shore or by boat, depending on water depth and placement. Baited crab traps were deployed in two reaches at a time. The baited crab traps, which targeted blue crabs, were checked daily for 3 days. If sufficient blue crabs were collected at a station to create at least one composited sample during that time, then the traps were moved to the next randomly selected station within a sample reach. If, after 3 days, insufficient numbers of blue crabs were collected at a station for one composite sample, then traps were moved to the next randomly selected station within the sample reach. Samples were collected from all three reaches: six samples from Reach 1, nine from Reach 2, and five from Reach 3 (Figure 2).

Hardhead catfish[1] were collected using a combination of crab traps and gillnets over a period of two weeks. Gear was also deployed from shore or boat. Collection techniques for the crab traps were the same for those used to collect blue crabs. Gillnets were set out for five hours. Four days of sampling were performed in Reaches 1, 2, and 3. This circuit was repeated until sufficient numbers of samples were collected. The placement of gillnets was determined by habitat type and initial sampling efficiency. Samples were collected from all three reaches: 13 samples from Reach 1 (and an additional three field duplicates), 14 from Reach 2, and three from Reach 3 (Figure 2).

[1] As described in the SAP, other catfish species were targeted in this sample collection effort. However, only hardhead catfish were caught.

2.4 Sample Processing Methods

Collected organisms were kept alive in live wells on a boat supplied with Site water or wrapped in aluminum foil and placed in polyethylene bags (e.g., Ziplocs®) on ice until they could be taken to the processing area. Blue crabs required depuration so they were placed into tanks to begin the required 24-hour depuration period. All other organisms were processed immediately. Organisms collected were identified to species.

Consistent with USEPA/U.S. Army Corps of Engineers (USACE) guidance (1998), digestive tracts of blue crabs were emptied prior to homogenization and analysis. Organisms were allowed to void the material in their digestive tracts by being held for 24-hours in filtered (0.45 micrometer [μm]) Site surface water. No sediment was included in the containers and temperature conditions were maintained at field collection conditions. Only organisms collected from within the same reach of the bayou were placed together in a depuration container.

Total carapace width (the tip of one lateral spine to the tip of the opposite lateral spine) and weight were measured and recorded for all blue crabs. Edible tissue was carefully extracted from the crab after the 24-hour depuration period. Edible tissue included all leg and claw meat, back shell meat, and body cavity meat. The hepatopancreas was not considered edible tissue. Edible tissue from five crabs was composited together to make one sample. Crabs included in the composite were all collected from the same location.

Total length and weight were measured and recorded for all collected fish. Both sides of the fish were filleted and processed in the same manner as described in the SAP and TCEQ and TDSHS methodology (TCEQ 2003 and TDSHS 2007). For each fish, both fillets (skin off) and remainder (i.e., skin, head, viscera, fins, skeleton, and musculature not obtained with the fillet) were retained for analysis as individuals. Only fillets were submitted for laboratory analysis.

All utensils used for handling or processing organisms (e.g., measuring boards, scale plates, forceps, scalpels, etc.) that came into contact with tissue were decontaminated prior to and between sample collection activities. All fish and crab processing activities (e.g., weighing,

measuring, and removing edible tissue) were conducted on a new sheet of aluminum foil. New aluminum foil was used for each sample.

2.5 Field Deviations from the SAP

There were no deviations from the SAP during this sampling event.

3 LABORATORY METHODS

This section briefly describes the analytical methods used to generate the chemistry data for the tissue samples in this report. A detailed description of the analytical methods can be found in the SAP (Anchor QEA 2011). This section also summarizes any deviations by the laboratory from the SAP. Analyses included: conventional parameters (lipid and percent moisture), polychlorinated biphenyl (PCB) congeners, and dioxins and furans.

3.1 Methods for Chemical Analysis

Table 1 summarizes the number of tissue samples that were analyzed for each of the chemical methods listed below. This report includes data analyses performed by SGS North America (SGS) in Wilmington, North Carolina. SGS performed all analyses and is National Environmental Laboratory Accreditation Certified (NELAC) accredited by the State of Florida Department of Health, Bureau of Laboratories, Certificate No. E87634. Seven data reports were received and validated from the laboratories. The laboratory data reports are provided in Appendix B. All of the data reports were sent to Laboratory Data Consultants, Inc. (LDC) for data validation. All data presented in this report reflect any findings reported in the validation reports.

3.2 Laboratory Deviations from the Quality Assurance Quality Plan or Sampling and Analysis Plan

This section discusses each of the laboratory's deviations from the SAP (Anchor QEA 2011). SGS adhered to the methods and procedures outlined in the SAP and as listed in SAP Table 4-2 with the following exceptions:

- The lipids analyses were done according to the National Oceanic Atmospheric Administration (NOAA) method instead of the Bligh & Dyer method specified in the SAP. The methods are similar, however, so data are comparable and this is not expected to affect data quality.
- Several PCB congener non-detected detection limits were above the project reporting limits due to high concentrations of target and non-target analytes. However, the risk-based tissue target practical quantitation limit (PQL) was met for all total PCB congener results.

4 ANALYTICAL DATA VALIDATION AND DATA MANAGEMENT

Third party data validation was performed on each dataset of chemical and physical analyses. Data validation verified the accuracy and precision of chemical and physical determinations performed during this investigation. This section presents the data validation results conducted by LDC. The following sections summarize the overall data quality and do not necessarily address each individual sample result affected by data qualification. Detailed information regarding sample result qualifications is available in the data validation reports in Appendix C.

4.1 Overall Data Quality

A review of the validation reports indicates that the overall data quality of the chemistry data generated was considered acceptable. Fifty-three tissue samples were sent to SGS for PCB congener, dioxin/furan, lipids, and moisture analyses. The data for these analyses were reported under seven sample delivery groups (SDG): 31102773, 31102774, 31102778, 31102779, 31102791, 31102792, and 31102899. These data reports were validated by LDC under two validation reports: 26753 and 26808.

Detailed data quality objectives and quality assurance (QA) procedures are provided in the SAP (Anchor QEA 2011). Data packages were validated by LDC under USEPA National Functional Guidelines (USEPA 1999, 2004, 2005, 2008) and using the guidelines outlined in the SAP. The validation reports are in Appendix C. Any data qualifiers applied to the data during the final validation procedures have been incorporated into the final database for this project. Data qualifiers assigned as a result of the data validation and their definitions are shown on the analytical results table (Appendix D). All data were considered useable as reported or as qualified and no data were rejected. Some data may have been qualified as estimated for a particular analysis based on method or technical criterion as stated in the functional guidelines (USEPA 1999, 2004, 2005, 2008). Data qualified with a "J" indicates that the associated numerical value is the approximate concentration of the analyte. Data qualified with a "UJ" indicates the approximate reporting limit below which the analyte was not detected. In some cases reporting limits were raised to account for method blank contamination or matrix interference.

4.2 Sample Transport and Holding Times

Samples were received at the laboratory intact and appropriately preserved. All analyses were performed within recommended holding times.

4.3 Laboratory Duplicate Results

Three laboratory duplicates were analyzed with these sample sets. Duplicates were analyzed for the same parameters as the parent samples. No precision requirements were specified in the SAP and no results were qualified based on duplicate results. Duplicate results are discussed in detail in the data validation reports.

4.4 Laboratory Quality Control

The validation reports indicate the majority of the data results did not require qualification. The laboratory followed the specified analytical methods or used comparable methods and all requested analyses were completed. Accuracy was acceptable as demonstrated by the ongoing precision and recovery (OPR), matrix spike/matrix spike duplicate (MS/MSD), and internal standard recoveries with some exceptions. Precision was acceptable as demonstrated by the MS/MSD relative percent difference values with some exceptions. Some reporting limits were elevated due to method blank contamination or matrix interference. All data are acceptable as reported or as qualified.

5 RESULTS

This section presents the results of the chemical analyses conducted on the hardhead catfish and blue crab tissue samples collected as part of this investigation. Only the final reporting limits and analytical results are presented in the tables associated with this section. The complete data table is presented in Appendix D.

Table 1 presents a list of the analyzed samples, stations from which the samples were collected, species, and size class. Tables 2 and 3 present a summary of the analytical results for the blue crab samples and the catfish samples, respectively. Also included in these tables is the number of detected samples, range of detected concentrations, average detected concentration, range of reporting limits for chemicals with reported non-detects, and average concentrations including non-detected values (non-detected values are included in the average calculation at values equal to one-half the detection limit). Both normal samples and field duplicate samples are included in the summary results. One-half the detection limit was used for calculating total values for PCB congeners and dioxin/furans. Data tables containing the results for each sample, including field duplicates, are presented in Appendix D.

5.1 General Summary

A total of 53 samples were analyzed in fulfillment of this investigation. These samples were comprised of 33 hardhead catfish samples (three of which were field duplicates) and 20 blue crab samples. All samples were analyzed for conventional parameters, including lipids and percent moisture, PCB congeners, and dioxin/furans.

5.2 Blue Crab

This section presents a summary of the analytical results from blue crab tissue samples. The blue crabs collected for these samples were all larger than 13 centimeters (cm; carapace width). Twenty samples were analyzed. Table 2 presents a summary of the analytical results.

5.2.1 Conventional Parameters

Lipids and moisture content were included in the conventional parameters analyses. Lipids ranged from 0.06% to 0.47%. The average lipid content for all samples was 0.16%. Moisture ranged from 75.9% to 84.0%. The average moisture content for all samples was 79.9%.

5.2.2 PCB Congeners

One-hundred and ninety-seven PCB congeners were detected in at least one sample. One-hundred and thirty-three were detected in all 20 samples. Concentrations of total PCB congeners ranged from 19.6 micrograms per kilogram (µg/kg) to 377 µg/kg. The average concentration of total PCB congeners was 112 µg/kg.

5.2.3 Dioxin/Furan Congeners

Sixteen dioxin/furan congeners were detected in at least one sample. 1,2,3,7,8,9-hexachlorodibenzofuran (HxCDF) was the only congener not detected in any samples. 2,3,7,8-tetrachlorodibenzofuran (TCDF) and 2,3,7,8-tetrachlorodibenzo-p-dioxin (TCDD) were the only two congeners detected in all 20 samples. Concentrations of total dioxin/furan congeners ranged from 1.6 nanograms per kilogram (ng/kg) to 9.29 ng/kg. The average concentration of total dioxin/furan congeners was 4.58 ng/kg.

5.3 Hardhead Catfish

This section presents a summary of the analytical results from hardhead catfish tissue samples. The catfish collected for these samples were all larger than 30 cm. Thirty-three samples were analyzed. Table 3 presents a summary of the analytical results.

5.3.1 Conventional Parameters

Lipids and moisture content were included in the conventional parameters analyses. Lipids ranged from 0.1% to 22.2%. The average lipid content for all samples was 3.53%. Moisture ranged from 73.5% to 84.0%. The average moisture content for all samples was 77.2%.

5.3.2 PCB Congeners

Two-hundred and one PCB congeners were detected in at least one sample. One-hundred and fifty-one were detected in all 33 samples. Total PCB congener concentrations ranged from 187 µg/kg to 5,362 µg/kg. The average total PCB congener concentration for all samples was 1,418 µg/kg.

5.3.3 Dioxin/Furan Congeners

Fifteen dioxin/furan congeners were detected in at least one sample. 1,2,3,4,7,8,9-heptachlorodibenzofuran (HpCDF) and 1,2,3,7,8,9-HxCDF were not detected in any sample. Two congeners, 2,3,4,7,8-pentachlorodibenzofuran (PeCDF) and 2,3,7,8-TCDD, were detected in all 33 samples. Total dioxin/furan congener concentrations ranged from 3.87 ng/kg to 112 ng/kg. The average total dioxin/furan congener concentration for all samples was 18.8 ng/kg.

6 SUMMARY

During this investigation, 20 blue crab tissue samples and 33 hardhead catfish tissue samples were successfully collected and analyzed. Overall, these samples were collected consistent with the SAP and are of sufficient quality to meet the sampling objectives outlined in Section 1.2.

The data collected during this investigation were used to support exposure assessment in the BHHRA. Sufficient data was also collected for the development of site-specific BSAFs for modeling future conditions and remedial scenarios. Baseline tissue concentrations of COPCs have also been established, which will provide a point of comparison for long-term (post-remediation) monitoring data.

December 21, 2011

SUBJECT: Patrick Bayou, BHHRA Data Validation

Dear Ms. Peterson,

Enclosed are the final validation reports for the fractions listed below. These SDGs were received on November 29, 2011. Attachment 1 is a summary of the samples that were reviewed for each analysis.

LDC Project # 26753:

SDG #	Fraction
31102791, 31102773 31102774, 31102778 31102792	Polychlorinated Biphenyls as Congeners, Dioxins/Dibenzofurans

The data validation was performed under EPA Level III guidelines. The analyses were validated using the following documents, as applicable to each method:

- USEPA, Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Diobenzofurans Data Review, September 2005
- EPA SW 846, Third Edition, Test Methods for Evaluating Solid Waste, update 1, July 1992; update IIA, August 1993; update II, September 1994; update IIB, January 1995; update III, December 1996; update IIIA, April 1998; IIIB, November 2004; Update IV, February 2007

Please feel free to contact us if you have any questions.

Sincerely,

Stella Cuenco

Stella S. Cuenco

Sample Delivery Group (SDG):	31102791

Sample Identification

EB-1110006-A01

Introduction

This data review covers one water sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 1613B for Polychlorinated Dioxins/Dibenzofurans.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review (September 2005).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified a P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

EMPC Estimated Maximum Possible Concentration

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required daily frequency.

The chromatographic resolution between 2,3,7,8-TCDD and the peaks representing any other unlabeled TCDD isomers was resolved with a valley of less than or equal to 25%.

PFK and static resolving power data were not provided, therefore not reviewed.

III. Initial Calibration

A five point initial calibration was performed as required by the method.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for unlabeled compounds and less than or equal to 35.0% for labeled compounds.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

IV. Routine Calibration (Continuing)

Routine calibration was performed at the required frequencies.

All of the routine calibration percent differences (%D) between the initial calibration RRF and the routine calibration RRF were within the QC limits.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated dioxin/dibenzofuran contaminants were found in the method blanks.

VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Ongoing Precision & Recovery Samples (OPR)

Ongoing precision and recovery (OPR) control samples were reviewed for each matrix as applicable. The percent recoveries (%R) and relative percent differences (RPD) were within the QC limits.

VIII. Regional Quality Assurance and Quality Control

Not applicable.

IX. Internal Standards

All internal standard recoveries were within QC limits.

X. Target Compound Identifications

Raw data were not reviewed for this SDG.

XI. Compound Quantitation and RLs

Raw data were not reviewed for this SDG.

XII. System Performance

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

The quality control criteria reviewed were met and are considered acceptable. Based upon the Level III data validation all results are considered valid and usable for all purposes.

XIV. Field Duplicates

No field duplicates were identified in this SDG.

XV. Field Blanks

Sample EB-1110006-A01 was identified as an equipment blank. No polychlorinated dioxin/dibenzofuran contaminants were found.

Data Validation Report

Project/Site Name:	Patrick Bayou, BHHRA
Collection Date:	October 6, 2011
LDC Report Date:	December 15, 2011
Matrix:	Water
Parameters:	Polychlorinated Biphenyls as Congeners
Validation Level:	EPA Level III
Laboratory:	SGS North America, Inc.
Sample Delivery Group (SDG):	31102791

Sample Identification

EB-1110006-A01

Introduction

This data review covers one water sample listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 1668B for Polychlorinated Biphenyls as Congeners.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review (September 2005).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required daily frequency.

Retention time windows were established for all congeners. The chromatographic resolution between the congeners PCB-23 and PCB-34 and congeners PCB-182 and PCB-187 was resolved with a valley of less than or equal to 40%.

III. Initial Calibration

A five point initial calibration was performed as required by the method.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

The ion abundance ratios for all PCBs were within method criteria.

The minimum S/N ratio was greater than or equal to 10 for each unlabeled compound and labeled compound.

IV. Routine Calibration (Continuing)

Routine calibration was performed at the required frequencies.

All of the routine calibration percent differences (%D) between the initial calibration RRF and the routine calibration RRF were less than or equal to 30.0% for unlabeled compounds and less than or equal to 50.0% for labeled compounds.

The ion abundance ratios for all PCBs were within method criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated biphenyls as congeners contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound	Concentration	Associated Samples
MB HXX1322	10/20/11	1-MoCB	2.56 pg/L	All samples in SDG 31102791
		4-MoCB	6.38 pg/L	
		6-DiCB	1.89 pg/L	
		7-DiCB	1.26 pg/L	
		8-DiCB	5.20 pg/L

	Total Dichlorobiphenyls	33.3 pg/L	33.3U pg/L

VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Ongoing Precision & Recovery Samples (OPR)

Ongoing precision and recovery (OPR) control samples were reviewed for each matrix as applicable. The percent recoveries (%R) and relative percent differences (RPD) were within the QC limits.

VIII. Regional Quality Assurance and Quality Control

Not applicable.

IX. Internal Standards

All internal standard recoveries (%R) were within QC limits with the following exceptions:

Sample	Internal Standards	%R (Limits)	Compound	Flag	A or P
EB-1110006-A01	169L-HxCB	127 (37-117)	128/166-HxCB 129/138/163-HxCB 130-HxCB 131-HxCB 132-HxCB 133-HxCB 134-HxCB 135/151-HxCB 136-HxCB 137-HxCB 139/140-HxCBC 141-HxCB 142-HxCB 143-HxCB 144-HxCB 145-HxCB 146-HxCB 147/149-HxCB 148-HxCB 150-HxCB 152-HxCB 153/168-HxCB 154-HxCB 158-HxCB 159-HxCB 160-HxCB 161-HxCB 162-HxCB 164-HxCB 165-HxCB 169-HxCB Total Hexachlorobiphenyls Total PCBs	J (all detects) UJ (all non-detects)	P

X. Target Compound Identifications

Raw data were not reviewed for this SDG.

XI. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG 31102791	All compounds reported by the laboratory as estimated maximum possible concentration (EMPC)	J (all detects)	A

Raw data were not reviewed for this SDG.

XII. System Performance

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to internal standards %R and compound quantitation problems, data were qualified as estimated in one sample.

Due to method blank contamination problems, data were qualified as nondetected in one sample.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Level III data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

No field duplicates were identified in this SDG.

XV. Field Blanks

Sample EB-1110006-A01 was identified as an equipment blank. No polychlorinated biphenyls as congeners contaminants were found with the following exceptions:

Equipment Blank ID	Compound	Concentration (pg/L)
EB-1110006-A01	1-MoCB	3.88 pg/L
	3-MoCB	2.81 pg/L

CIRCLED RESULTS WERE NOT QUALIFIED. ALL RESULTS NOT CIRCLED WERE QUALIFIED BY THE FOLLOWING STATEMENT:
All contaminants within five times the method blank concentr/ation were qualified as not detected, "U".

LDC #: 26753A31

VALIDATION FINDINGS WORKSHEET
Internal Standards

Page: 1 of 1
Reviewer: 9
2nd Reviewer: [illegible]

METHOD: HRGC/HRMS PCB Congeners (EPA Method 1668B)
Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

Y N N/A Are all internal standard recoveries were within the QC criteria?
Y N N/A Was the Ion Abundance Ratio within criteria?
Y N N/A Was the S/N ratio all internal standard peaks ≥ 10?

Introduction

This data review covers 10 tissue samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 1613B for Polychlorinated Dioxins/Dibenzofurans.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review (September 2005).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified a P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

EMPC Estimated Maximum Possible Concentration

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required daily frequency.

The chromatographic resolution between 2,3,7,8-TCDD and the peaks representing any other unlabeled TCDD isomers was resolved with a valley of less than or equal to 25%.

PFK and static resolving power data were not provided, therefore not reviewed.

III. Initial Calibration

A five point initial calibration was performed as required by the method.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for unlabeled compounds and less than or equal to 35.0% for labeled compounds.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

IV. Routine Calibration (Continuing)

Routine calibration was performed at the required frequencies.

All of the routine calibration percent differences (%D) between the initial calibration RRF and the routine calibration RRF were within the QC limits.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated dioxin/dibenzofuran contaminants were found in the method blanks.

VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VII. Ongoing Precision & Recovery Samples (OPR)

Ongoing precision and recovery (OPR) control samples were reviewed for each matrix as applicable. The percent recoveries (%R) and relative percent differences (RPD) were within the QC limits.

VIII. Regional Quality Assurance and Quality Control

Not applicable.

IX. Internal Standards

All internal standard recoveries were within QC limits.

X. Target Compound Identifications

Raw data were not reviewed for this SDG.

XI. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG 31102773	All compounds reported by the laboratory as estimated maximum possible concentration (EMPC)	J (all detects)	A
All samples in SDG 31102773	The Polychlorinated Diphenyl Ether (PCDPE) interferences were above the S/N ratio of 2.5.	J (all detects) UJ (all non-detects)	A

Raw data were not reviewed for this SDG.

XII. System Performance

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to compound quantitation problems, data were qualified as estimated in seven samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Level III data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

Samples PB01-F-C-HHC-E-024-20111002 and PB01-F-C-HHC-E-024-201110-D (from SDG 31102774) were identified as field duplicates. No polychlorinated dioxins/dibenzofurans were detected in any of the samples with the following exceptions:

Introduction

This data review covers 10 tissue samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 1668B for Polychlorinated Biphenyls as Congeners.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review (September 2005).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required daily frequency.

Retention time windows were established for all congeners. The chromatographic resolution between the congeners PCB-23 and PCB-34 and congeners PCB-182 and PCB-187 was resolved with a valley of less than or equal to 40%.

III. Initial Calibration

A five point initial calibration was performed as required by the method.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

The ion abundance ratios for all PCBs were within method criteria.

The minimum S/N ratio was greater than or equal to 10 for each unlabeled compound and labeled compound.

IV. Routine Calibration (Continuing)

Routine calibration was performed at the required frequencies.

All of the routine calibration percent differences (%D) between the initial calibration RRF and the routine calibration RRF were less than or equal to 30.0% for unlabeled compounds and less than or equal to 50.0% for labeled compounds.

The ion abundance ratios for all PCBs were within method criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated biphenyls as congeners contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound	Concentration	Associated Samples

VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) were not within QC limits. Since the sample concentration was greater than the spiked concentration, no data were qualified.

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VII. Ongoing Precision & Recovery Samples (OPR)

Ongoing precision and recovery (OPR) control samples were reviewed for each matrix as applicable. The percent recoveries (%R) and relative percent differences (RPD) were within the QC limits.

VIII. Regional Quality Assurance and Quality Control

Not applicable.

IX. Internal Standards

All internal standard recoveries (%R) were within QC limits with the following exceptions:

X. Target Compound Identifications

Raw data were not reviewed for this SDG.

XI. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG 31102773	All compounds reported by the laboratory as estimated maximum possible concentration (EMPC)	J (all detects)	A

Raw data were not reviewed for this SDG.

XII. System Performance

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to internal standards %R and compound quantitation problems, data were qualified as estimated in seven samples.

Due to method blank contamination problems, data were qualified as nondetected in seven samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Level III data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

Samples PB01-F-C-HHC-E-024-20111002 and PB01-F-C-HHC-E-024-201110-D (from SDG 311102774) were identified as field duplicates. No polychlorinated biphenyls were detected in any of the samples with the following exceptions:

Laboratory: SGS North America Inc. Reviewer: [illegible]

2nd Reviewer: [illegible]

METHOD: HRGC/HRMS Polychlorinated Biphenyls as Congeners (EPA Method 1668B)

The samples listed below were reviewed for each of the following validation areas. Validation findings are noted in attached validation findings worksheets.

	Validation Area		Comments
I.	Technical holding times	A	Sampling dates: 9/29-10/2/11. Temp @ 13.2-15.8 °C
II.	HRGC/HRMS Instrument performance check	A	
III.	Initial calibration	A	20%
IV.	Routine calibration/~~ICV~~	A	~~RRF~~ CCV ≤ 30/50%
V.	Blanks	SW	
VI.	Matrix spike/Matrix spike duplicates/~~DUP~~	SW	(DUP = 5x)
VII.	Laboratory control samples	A	OPR
VIII.	Regional quality assurance and quality control	N	
IX.	Internal standards	SW	
X.	Target compound identifications	N	
XI.	Compound quantitation/RL/~~LOQ/LODs~~	N	
XII.	System performance	N	
XIII.	Overall assessment of data	A	
XIV.	Field duplicates	SW	D = ~~5+6~~ 8+9 PB01-F-C-HHC-E-024-20111D+D (31110277A)
XV.	Field blanks	N	

Note: A = Acceptable; N = Not provided/applicable; SW = See worksheet; ND = No compounds detected; R = Rinsate; FB = Field blank; D = Duplicate; TB = Trip blank; EB = Equipment blank

Validated Samples:** Indicates sample underwent Level IV validation

METHOD: HRGC/HRMS Polychlorinated Biphenyls (EPA Method 1668B)

Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

Y N N/A Were a matrix spike (MS) and matrix spike duplicate (MSD) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD. Soil / Water.

Y N N/A Was a MS/MSD analyzed every 20 samples of each matrix?

Y N N/A Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the QC limits?

METHOD: HRGC/HRMS PCB Congeners (EPA Method 1668B)
Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

Y N N/A Are all internal standard recoveries were within the QC criteria?
Y N N/A Was the Ion Abundance Ratio within criteria?
Y N N/A Was the S/N ratio all internal standard peaks ≥ 10?

METHOD: HRGC/HRMS PCB Congeners (EPA Method 1668B)

Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

Y N N/A Were the correct internal standard (IS), quantitation ions and relative response factors (RRF) used to quantitate the compound?
Y N N/A Compound quantitation and CRQLs were adjusted to reflect all sample dilutions and dry weight factors (if necessary).

Introduction

This data review covers 10 tissue samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 1613B for Polychlorinated Dioxins/Dibenzofurans.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review (September 2005).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified a P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

EMPC Estimated Maximum Possible Concentration

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required daily frequency.

The chromatographic resolution between 2,3,7,8-TCDD and the peaks representing any other unlabeled TCDD isomers was resolved with a valley of less than or equal to 25%.

PFK and static resolving power data were not provided, therefore not reviewed.

III. Initial Calibration

A five point initial calibration was performed as required by the method.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for unlabeled compounds and less than or equal to 35.0% for labeled compounds.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

IV. Routine Calibration (Continuing)

Routine calibration was performed at the required frequencies.

All of the routine calibration percent differences (%D) between the initial calibration RRF and the routine calibration RRF were within the QC limits.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated dioxin/dibenzofuran contaminants were found in the method blanks.

VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits.

VII. Ongoing Precision & Recovery Samples (OPR)

Ongoing precision and recovery (OPR) control samples were reviewed for each matrix as applicable. The percent recoveries (%R) and relative percent differences (RPD) were within the QC limits.

VIII. Regional Quality Assurance and Quality Control

Not applicable.

IX. Internal Standards

All internal standard recoveries were within QC limits.

X. Target Compound Identifications

Raw data were not reviewed for this SDG.

XI. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG 31102774	All compounds reported by the laboratory as estimated maximum possible concentration (EMPC)	J (all detects)	A
All samples in SDG 31102774	The Polychlorinated Diphenyl Ether (PCDPE) interferences were above the S/N ratio of 2.5.	J (all detects) UJ (all non-detects)	A

Raw data were not reviewed for this SDG.

XII. System Performance

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to compound quantitation problems, data were qualified as estimated in nine samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Level III data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

Samples PB01-F-C-HHC-E-024-20111002 (from SDG 31102773) and PB01-F-C-HHC-E-024-201110-D, samples PB01-F-C-HHC-E-025-20111002 and PB01-F-C-HHC-E-025-201110-D, and samples PB01-F-C-HHC-E-026-20111002 and PB01-F-C-HHC-E-026-201110-D were identified as field duplicates. No polychlorinated dioxins/dibenzofurans were detected in any of the samples with the following exceptions:

Compound	Concentration (pg/g)		RPD

Introduction

This data review covers 10 tissue samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 1668B for Polychlorinated Biphenyls as Congeners.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review (September 2005).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required daily frequency.

Retention time windows were established for all congeners. The chromatographic resolution between the congeners PCB-23 and PCB-34 and congeners PCB-182 and PCB-187 was resolved with a valley of less than or equal to 40%.

III. Initial Calibration

A five point initial calibration was performed as required by the method.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

The ion abundance ratios for all PCBs were within method criteria.

The minimum S/N ratio was greater than or equal to 10 for each unlabeled compound and labeled compound.

IV. Routine Calibration (Continuing)

Routine calibration was performed at the required frequencies.

All of the routine calibration percent differences (%D) between the initial calibration RRF and the routine calibration RRF were less than or equal to 30.0% for unlabeled compounds and less than or equal to 50.0% for labeled compounds.

The ion abundance ratios for all PCBs were within method criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated biphenyls as congeners contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound	Concentration	Associated Samples

VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

Duplicate (DUP) sample analyses were reviewed for each matrix as applicable. Results were within QC limits with the following exceptions:

DUP ID (Associated Samples)	Compound	RPD (Limits)	Flag	A or P
PB01-F-C-HHC-E-027-20111002DUP (PB01-F-C-HHC-E-027-20111002)	55-TeCB	58 (≤50)	J (all detects)	A

VII. Ongoing Precision & Recovery Samples (OPR)

Ongoing precision and recovery (OPR) control samples were reviewed for each matrix as applicable. The percent recoveries (%R) and relative percent differences (RPD) were within the QC limits.

VIII. Regional Quality Assurance and Quality Control

Not applicable.

IX. Internal Standards

All internal standard recoveries (%R) were within QC limits with the following exceptions:

Sample	Internal Standards	%R (Limits)	Compound	Flag	A or P

X. Target Compound Identifications

Raw data were not reviewed for this SDG.

XI. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG 31102774	All compounds reported by the laboratory as estimated maximum possible concentration (EMPC)	J (all detects)	A

Raw data were not reviewed for this SDG.

XII. System Performance

Raw data were not reviewed for this SDG.

Sample	Internal Standards	%R (Limits)	Compound	Flag	A or P
PB01-I-C-BCR-E-004-20111001	169L-HxCB	125 (37-117)	128/166-HxCB 129/138/163-HxCB 130-HxCB 131-HxCB 132-HxCB 133-HxCB 134-HxCB 135/151-HxCB 136-HxCB 137-HxCB 139/140-HxCB 141-HxCB 142-HxCB 143-HxCB 144-HxCB 145-HxCB 146-HxCB 147/149-HxCB 148-HxCB 150-HxCB 152-HxCB 153/168-HxCB 154-HxCB 158-HxCB 159-HxCB 160-HxCB 161-HxCB 162-HxCB 164-HxCB 165-HxCB 169-HxCB Total Hexachlorobiphenyls Total PCBs	J (all detects) UJ (all non-detects)	P

X. Target Compound Identifications

Raw data were not reviewed for this SDG.

XI. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG 31102774	All compounds reported by the laboratory as estimated maximum possible concentration (EMPC)	J (all detects)	A

Raw data were not reviewed for this SDG.

XII. System Performance

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to duplicate RPD, internal standards %R and compound quantitation problems, data were qualified as estimated in nine samples.

Due to method blank contamination problems, data were qualified as nondetected in nine samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Level III data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

Samples PB01-F-C-HHC-E-024-20111002 (from SDG 311102773) and PB01-F-C-HHC-E-024-201110-D, samples PB01-F-C-HHC-E-025-20111002 and PB01-F-C-HHC-E-025-201110-D, and samples PB01-F-C-HHC-E-026-20111002 and PB01-F-C-HHC-E-026-201110-D were identified as field duplicates. No polychlorinated biphenyls were detected in any of the samples with the following exceptions:

Compound	Concentration (pg/g)		RPD

LDC #: 26753C31 **VALIDATION COMPLETENESS WORKSHEET** Date: 12/4/11
SDG #: 31102774 Level III Page: 1 of 1
Laboratory: SGS North America Inc. Reviewer: [illegible]
2nd Reviewer: [illegible]

METHOD: HRGC/HRMS Polychlorinated Biphenyls as Congeners (EPA Method 1668B)

The samples listed below were reviewed for each of the following validation areas. Validation findings are noted in attached validation findings worksheets.

	Validation Area		Comments
I.	Technical holding times	A	Sampling dates: 9/30-10/2/11
II.	HRGC/HRMS Instrument performance check	A	
III.	Initial calibration	A	20%
IV.	Routine calibration/~~ICV~~	A	30/50%
V.	Blanks	SW	
VI.	Matrix spike/Matrix spike duplicates /DUP	N/SW	CS
VII.	Laboratory control samples	A	OPR
VIII.	Regional quality assurance and quality control	N	
IX.	Internal standards	SW	
X.	Target compound identifications	N	
XI.	Compound quantitation/RL/LOQ/LODs	SN	2MPC — blets/A
XII.	System performance	N	
XIII.	Overall assessment of data	A	
XIV.	Field duplicates	SW	D=2+3. 4+5. 1+PB01-F-C-HHC-E-024-20111002
XV.	Field blanks	N	(3TO 2TT3)

Note: A = Acceptable; N = Not provided/applicable; SW = See worksheet; ND = No compounds detected; R = Rinsate; FB = Field blank; D = Duplicate; TB = Trip blank; EB = Equipment blank

Validated Samples:** Indicates sample underwent Level IV validation

METHOD: HRGC/HRMS Polychlorinated Biphenyls (EPA Method 1668B)

Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

Y N N/A Were a matrix spike (MS) and matrix spike duplicate (MSD) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD. Soil / Water.

Y N N/A Was a MS/MSD analyzed every 20 samples of each matrix?

Y N N/A Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the QC limits?

PB02-F-C-HHC-E-003-20110929MSD

Introduction

This data review covers 10 tissue samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 1613B for Polychlorinated Dioxins/Dibenzofurans.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review (September 2005).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified a P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

EMPC Estimated Maximum Possible Concentration

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required daily frequency.

The chromatographic resolution between 2,3,7,8-TCDD and the peaks representing any other unlabeled TCDD isomers was resolved with a valley of less than or equal to 25%.

PFK and static resolving power data were not provided, therefore not reviewed.

III. Initial Calibration

A five point initial calibration was performed as required by the method.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for unlabeled compounds and less than or equal to 35.0% for labeled compounds.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

IV. Routine Calibration (Continuing)

Routine calibration was performed at the required frequencies.

All of the routine calibration percent differences (%D) between the initial calibration RRF and the routine calibration RRF were within the QC limits.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated dioxin/dibenzofuran contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound	Concentration	Associated Samples
LMB HXX1339	10/28/11	OCDD	0.196 pg/g	PB01-I-C-BCR-E-006-20111001
		2,3,7,8-TCDF	0.0860 pg/g	PB02-F-C-HHC-E-001-20110929
		1,2,3,7,8-PeCDF	0.0520 pg/g	PB02-F-C-HHC-E-003-20110929
		2,3,4,7,8-PeCDF	0.0560 pg/g	PB02-F-C-HHC-E-004-20110929
		1,2,3,4,7,8-HxCDF	0.0580 pg/g	PB02-F-C-HHC-E-005-20110929
		1,2,3,6,7,8-HxCDF	0.0320 pg/g	
		2,3,4,6,7,8-HxCDF	0.0300 pg/g	
		1,2,3,7,8,9-HxCDF	0.0340 pg/g	
		Total TCDD	0.152 pg/g	
		Total TCDF	0.132 pg/g	
		Total PeCDF	0.108 pg/g	
		Total HxCDD	0.384 pg/g	
		Total HxCDF	0.154 pg/g	

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>5X blank contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound	Reported Concentration	Modified Final Concentration
PB01-I-C-BCR-E-006-20111001	1,2,3,4,7,8-HxCDF	0.136 pg/g	0.136U pg/g
	1,2,3,6,7,8-HxCDF	0.0799 pg/g	0.0799U pg/g
	2,3,4,6,7,8-HxCDF	0.0507 pg/g	0.0507U pg/g
	1,2,3,7,8,9-HxCDF	0.0702 pg/g	0.0702U pg/g
	Total HxCDD	0.817 pg/g	0.817U pg/g
PB02-F-C-HHC-E-001-20110929	2,3,4,6,7,8-HxCDF	0.113 pg/g	0.113U pg/g
	Total HxCDD	1.35 pg/g	1.35U pg/g
PB02-F-C-HHC-E-003-20110929	OCDD	0.463 pg/g	0.463U pg/g
	2,3,7,8-TCDF	0.352 pg/g	0.352U pg/g
	1,2,3,7,8-PeCDF	0.0793 pg/g	0.0793U pg/g
	1,2,3,4,7,8-HxCDF	0.0775 pg/g	0.0775U pg/g
	1,2,3,6,7,8-HxCDF	0.0443 pg/g	0.0443U pg/g
	Total TCDF	0.423 pg/g	0.423U pg/g
	Total HxCDD	0.731 pg/g	0.731U pg/g
	Total HxCDF	0.164 pg/g	0.164U pg/g
PB02-F-C-HHC-E-004-20110929	2,3,4,6,7,8-HxCDF	0.133 pg/g	0.133U pg/g
	Total HxCDD	0.974 pg/g	0.974U pg/g
PB02-F-C-HHC-E-005-20110929	1,2,3,4,7,8-HxCDF	0.231 pg/g	0.231U pg/g
	Total HxCDD	0.960 pg/g	0.960U pg/g

VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VII. Ongoing Precision & Recovery Samples (OPR)

Ongoing precision and recovery (OPR) control samples were reviewed for each matrix as applicable. The percent recoveries (%R) and relative percent differences (RPD) were within the QC limits.

VIII. Regional Quality Assurance and Quality Control

Not applicable.

IX. Internal Standards

All internal standard recoveries were within QC limits.

X. Target Compound Identifications

Raw data were not reviewed for this SDG.

XI. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG 31102778	All compounds reported by the laboratory as estimated maximum possible concentration (EMPC)	J (all detects)	A

Raw data were not reviewed for this SDG.

XII. System Performance

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to compound quantitation problems, data were qualified as estimated in eight samples.

Due to method blank contamination problems, data were qualified as nondetected in five samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for

limited purposes only. Based upon the Level III data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

No field duplicates were identified in this SDG.

XV. Field Blanks

No field blanks were identified in this SDG.

Introduction

This data review covers 10 tissue samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 1668B for Polychlorinated Biphenyls as Congeners.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review (September 2005).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required daily frequency.

Retention time windows were established for all congeners. The chromatographic resolution between the congeners PCB-23 and PCB-34 and congeners PCB-182 and PCB-187 was resolved with a valley of less than or equal to 40%.

III. Initial Calibration

A five point initial calibration was performed as required by the method.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

The ion abundance ratios for all PCBs were within method criteria.

The minimum S/N ratio was greater than or equal to 10 for each unlabeled compound and labeled compound.

IV. Routine Calibration (Continuing)

Routine calibration was performed at the required frequencies.

All of the routine calibration percent differences (%D) between the initial calibration RRF and the routine calibration RRF were less than or equal to 30.0% for unlabeled compounds and less than or equal to 50.0% for labeled compounds.

The ion abundance ratios for all PCBs were within method criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated biphenyls as congeners contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Extraction Date	Compound	Concentration	Associated Samples

VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) were not within QC limits. Since the sample concentration was greater than the spiked concentration, no data were qualified.

VII. Ongoing Precision & Recovery Samples (OPR)

Ongoing precision and recovery (OPR) control samples were reviewed for each matrix as applicable. The percent recoveries (%R) and relative percent differences (RPD) were within the QC limits.

VIII. Regional Quality Assurance and Quality Control

Not applicable.

IX. Internal Standards

All internal standard recoveries (%R) were within QC limits with the following exceptions:

Sample	Internal Standards	%R (Limits)	Compound	Flag	A or P

X. Target Compound Identifications

Raw data were not reviewed for this SDG.

XI. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG 31102778	All compounds reported by the laboratory as estimated maximum possible concentration (EMPC)	J (all detects)	A

Raw data were not reviewed for this SDG.

XII. System Performance

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to internal standards %R and compound quantitation problems, data were qualified as estimated in eight samples.

Due to method blank contamination problems, data were qualified as nondetected in eight samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Level III data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

No field duplicates were identified in this SDG.

XV. Field Blanks

No field blanks were identified in this SDG.

LDC #: 26753D31 **VALIDATION COMPLETENESS WORKSHEET** Date: 12/13/11
SDG #: 31102778 Level III Page: 1 of 1
Laboratory: SGS North America Inc. Reviewer: [illegible]
2nd Reviewer: [illegible]

METHOD: HRGC/HRMS Polychlorinated Biphenyls as Congeners (EPA Method 1668B)

The samples listed below were reviewed for each of the following validation areas. Validation findings are noted in attached validation findings worksheets.

	Validation Area		Comments
I.	Technical holding times	A	Sampling dates: 9/29-10/1/11. Temp @ 13.2-15.8°C
II.	HRGC/HRMS Instrument performance check	A	
III.	Initial calibration	A	20/0
IV.	Routine calibration/ICV	A	30/50/0
V.	Blanks	SW	
VI.	Matrix spike/Matrix spike duplicates	SW	TOR and HW sensual cpd - Dolbual (>4xSA) - 9/10
VII.	Laboratory control samples	A	OPR
VIII.	Regional quality assurance and quality control	N	
IX.	Internal standards	SW	
X.	Target compound identifications	N	
XI.	Compound quantitation/RL/LOQ/LODs	N	~~results~~ 2MPC results - Jdet/A
XII.	System performance	N	
XIII.	Overall assessment of data	A	
XIV.	Field duplicates	N	
XV.	Field blanks	N	

Note: A = Acceptable; N = Not provided/applicable; SW = See worksheet; ND = No compounds detected; R = Rinsate; FB = Field blank; D = Duplicate; TB = Trip blank; EB = Equipment blank

Validated Samples:** Indicates sample underwent Level IV validation

Introduction

This data review covers 10 tissue samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 1613B for Polychlorinated Dioxins/Dibenzofurans.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review (September 2005).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified a P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

EMPC Estimated Maximum Possible Concentration

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required daily frequency.

The chromatographic resolution between 2,3,7,8-TCDD and the peaks representing any other unlabeled TCDD isomers was resolved with a valley of less than or equal to 25%.

PFK and static resolving power data were not provided, therefore not reviewed.

III. Initial Calibration

A five point initial calibration was performed as required by the method.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for unlabeled compounds and less than or equal to 35.0% for labeled compounds.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

IV. Routine Calibration (Continuing)

Routine calibration was performed at the required frequencies.

All of the routine calibration percent differences (%D) between the initial calibration RRF and the routine calibration RRF were within the QC limits.

The ion abundance ratios for all PCDDs and PCDFs were within validation criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated dioxin/dibenzofuran contaminants were found in the method blanks.

VI. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Ongoing Precision & Recovery Samples (OPR)

Ongoing precision and recovery (OPR) control samples were reviewed for each matrix as applicable. The percent recoveries (%R) and relative percent differences (RPD) were within the QC limits.

VIII. Regional Quality Assurance and Quality Control

Not applicable.

IX. Internal Standards

All internal standard recoveries were within QC limits.

X. Target Compound Identifications

Raw data were not reviewed for this SDG.

XI. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG 31102792	All compounds reported by the laboratory as estimated maximum possible concentration (EMPC)	J (all detects)	A

Raw data were not reviewed for this SDG.

XII. System Performance

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to compound quantitation problems, data were qualified as estimated in ten samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Level III data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified

XIV. Field Duplicates

No field duplicates were identified in this SDG.

XV. Field Blanks

No field blanks were identified in this SDG.

Introduction

This data review covers 10 tissue samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 1668B for Polychlorinated Biphenyls as Congeners.

This review follows USEPA Contract Laboratory Program National Functional Guidelines for Polychlorinated Dioxins/Dibenzofurans Data Review (September 2005).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected at or above the stated limit.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of the presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. HRGC/HRMS Instrument Performance Check

Instrument performance was checked at the required daily frequency.

Retention time windows were established for all congeners. The chromatographic resolution between the congeners PCB-23 and PCB-34 and congeners PCB-182 and PCB-187 was resolved with a valley of less than or equal to 40%.

III. Initial Calibration

A five point initial calibration was performed as required by the method.

Percent relative standard deviations (%RSD) were less than or equal to 20.0% for all compounds.

The ion abundance ratios for all PCBs were within method criteria.

The minimum S/N ratio was greater than or equal to 10 for each unlabeled compound and labeled compound.

IV. Routine Calibration (Continuing)

Routine calibration was performed at the required frequencies.

All of the routine calibration percent differences (%D) between the initial calibration RRF and the routine calibration RRF were less than or equal to 30.0% for unlabeled compounds and less than or equal to 50.0% for labeled compounds.

The ion abundance ratios for all PCBs were within method criteria.

V. Blanks

Method blanks were reviewed for each matrix as applicable. No polychlorinated biphenyls as congeners contaminants were found in the method blanks with the following exceptions:

VI. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) were not within QC limits. Since the sample concentration was greater than the spiked concentration, no data were qualified.

VII. Ongoing Precision & Recovery Samples (OPR)

Ongoing precision and recovery (OPR) control samples were reviewed for each matrix as applicable. The percent recoveries (%R) and relative percent differences (RPD) were within the QC limits.

VIII. Regional Quality Assurance and Quality Control

Not applicable.

IX. Internal Standards

All internal standard recoveries (%R) were within QC limits with the following exceptions:

X. Target Compound Identifications

Raw data were not reviewed for this SDG.

XI. Compound Quantitation and RLs

All compound quantitation and RLs were within validation criteria with the following exceptions:

Sample	Compound	Flag	A or P
All samples in SDG 31102792	All compounds reported by the laboratory as estimated maximum possible concentration (EMPC)	J (all detects)	A

Raw data were not reviewed for this SDG.

XII. System Performance

Raw data were not reviewed for this SDG.

XIII. Overall Assessment of Data

The analysis was conducted within all specifications of the method. No results were rejected in this SDG.

Due to internal standards %R and compound quantitation problems, data were qualified as estimated in ten samples.

Due to method blank contamination problems, data were qualified as nondetected in ten samples.

The quality control criteria reviewed, other than those discussed above, were met and are considered acceptable. Sample results that were found to be estimated (J) are usable for limited purposes only. Based upon the Level III data validation all other results are considered valid and usable for all purposes.

Data flags are summarized at the end of this report if data has been qualified.

XIV. Field Duplicates

No field duplicates were identified in this SDG.

XV. Field Blanks

No field blanks were identified in this SDG.

VALIDATION COMPLETENESS WORKSHEET

Level III/~~IV~~

Date: 12/14/11

Page: 1 of 1

Reviewer:

2nd Reviewer:

METHOD: HRGC/HRMS Polychlorinated Biphenyls as Congeners (EPA Method 1668B)

The samples listed below were reviewed for each of the following validation areas. Validation findings are noted in attached validation findings worksheets.

	Validation Area		Comments
I.	Technical holding times	A	Sampling dates: 10/3-4/11
II.	HRGC/HRMS Instrument performance check	A	
III.	Initial calibration	A	20%
IV.	Routine calibration/~~ICV~~	A	30/50%
V.	Blanks	SW	
VI.	Matrix spike/Matrix spike duplicates	N	CS
VII.	Laboratory control samples	A	OPR
VIII.	Regional quality assurance and quality control	N	
IX.	Internal standards	SW	
X.	Target compound identifications	N	~~Not reviewed for Level III~~ validation.
XI.	Compound quantitation/RL/LOQ/LODs	SW	Not reviewed for Level III validation. 2MPe-Udets/A
XII.	System performance	N	Not reviewed for ~~Level III validation~~.
XIII.	Overall assessment of data	A	
XIV.	Field duplicates	N	
XV.	Field blanks	N	

Note: A = Acceptable; N = Not provided/applicable; SW = See worksheet; ND = No compounds detected; R = Rinsate; FB = Field blank; D = Duplicate; TB = Trip blank; EB = Equipment blank

CIRCLED RESULTS WERE NOT QUALIFIED. ALL RESULTS NOT CIRCLED WERE QUALIFIED BY THE FOLLOWING STATEMENT:
All contaminants within five times the method blank concentr/ation were qualified as not detected, "U".

LDC #: 26[3231

VALIDATION FINDINGS WORKSHEET
Internal Standards

Page: 1 of 1
Reviewer: 9
2nd Reviewer: 1

METHOD: HRGC/HRMS PCB Congeners (EPA Method 1668B)
Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

Y N N/A Are all internal standard recoveries were within the QC criteria?
Y N N/A Was the Ion Abundance Ratio within criteria?
Y N N/A Was the S/N ratio all internal standard peaks ≥ 10?
