Subject: Soil Removal Action Completion Report, College for Certain, LLC, Former Pacific Electric Motors, 1009 66th Avenue, Oakland, California (Fuel Leak Case No. RO0000411)

Dear Mr. Khatri:

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who managed the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

If you have any questions or comments, please call Charles Robitaille at 925-698-1118, Ron Goloubow of ARCADIS at 510-596-9550, or me at 510-434-5000.

Sincerely,

Michael Barr

1. Introduction

ARCADIS U.S., Inc. (ARCADIS) has prepared this Soil Removal Action Completion Report on behalf of College for Certain, LLC (CFC) to document the remedial activities conducted for soil affected by total petroleum hydrocarbons (TPH) as gasoline (TPHg), TPH as diesel (TPHd), TPH as motor oil (TPHmo), arsenic, lead, semivolatile organic compounds (SVOCs), polychlorinated biphenyls (PCBs), and volatile organic compounds (VOCs) at the former Pacific Electric Motors (PEM) Facility located at 1009 66th Avenue, Oakland, Alameda County, California ("the Site"; Figures 1 and 2).

The removal of the soil affected by PCBs was documented in a letter report that was prepared in accordance with the Toxic Substance Control Act (TSCA) and transmitted to U.S. Environmental Protection Agency (U.S. EPA) on August 13, 2010 ("the TSCA Report").

The removal action was conducted in accordance with the "Revised Corrective Action Plan, Proposed Aspire High School Site, 1009 66th Avenue, Oakland, California (Fuel Leak Case No. RO0000411)," prepared by LFR Inc. (now ARCADIS) and dated July 17, 2009 ("the revised CAP"). The revised CAP was approved by the Alameda County Department of Environmental Health (ACDEH) in their letter to Aspire Charter Schools dated August 13, 2009.

The fuel-affected groundwater at the Site is being remediated by an air-sparging-soil-vapor extraction system (AS-SVE). The AS-SVE is currently operating and the operation, maintenance, and monitoring of this system is being reported to the ACDEH on a quarterly basis in conjunction with the groundwater monitoring plan for the Site. The evaluation and assessment for closure of the groundwater remediation will continue under the groundwater monitoring plan for the Site.

The overall purpose of the revised CAP is to ensure that the Site is properly characterized and remediated prior to the redevelopment of the property as a Charter School for grades 6 through 12. As identified in the scope of the revised CAP, and based on the analytical results of the soil samples collected at the Site, a total of seven individual areas of affected soil were excavated (Figure 2).

This report documents the implementation of the scope of work associated with the removal of affected soil provided in the revised CAP. Included is this report is a description of the completed field activities, drawings indicating the final limits of excavation and post-excavation sampling locations, information on soil disposal,

tabulated analytical data, and copies of the laboratory-certified analytical reports and chain-of-custody documentation.

Based on the following information, a recommendation of No Further Action for soil-quality-related issues at the Site is being proposed.

1.1 Background and Site Description

The proposed Aspire Charter High School project site is located at 1009 66th Avenue, Oakland, California. The Assessor's Parcel Number designated by the Alameda County Assessor's Office for the Site is 041-4056-003. The Site is currently owned by CFC. The proposed redevelopment plan for the Site is to construct a Charter School on the 2.51-acre Site.

The Site is located on the western side of 66th Avenue between East 14th Street (to the north) and San Leandro Street (to the south). The area around the Site is developed with a mixture of commercial, industrial, government, and multi-family residential buildings. The Site is bounded by residential developments to the north, east, and south, Oakland Fire Department Station Number 2 to the southeast across 66th Avenue, and a vacant warehouse (formerly occupied by Service West) to the west.

Two warehouse structures were previously located on the Site. One two-story structure that was used for office space and manufacturing purposes and encompassed approximately 27,000 square feet of the property was located on the eastern portion of the Site. The second structure was located on the northeastern portion of the Site and encompassed approximately 5,000 square feet. Both of these structures were demolished in January 2010.

The Site is located at an elevation of approximately 7 feet above mean sea level, and the surface topography in the site vicinity slopes gradually toward the south-southwest. The nearest body of surface water is Lion Creek, located approximately 250 feet south of the Site. San Leandro Bay, connected to San Francisco Bay, is located approximately 4,500 feet southwest of the Site.

1.1.1 History of Site Occupation

The first documented land use at the Site was residential, as evidenced by a 1947 aerial photograph that reportedly shows a house and several out buildings on the Site

(Environ 1997 and ACC 2000). The first industrial development of the property was in about 1948 when the two warehouse buildings that were recently demolished at the Site were constructed by PEM; PEM occupied the Site from 1948 to 2001.

The former two-story building was shown on the 1950 aerial photograph, according to Environ's Phase I Environmental Assessment Report (Environ 1997). Portions of the Site were paved and the area behind the building was vegetated in the 1950 aerial photograph.

The smaller warehouse formally located on the northeastern portion of the Site initially appeared on the Site in the 1957 photograph (Environ 1997). A gasoline shed is visible on the Site in each of the aerial photographs from 1957 through the mid-1990s reviewed by Environ. Environ noted several square objects along the western border of the Site and on the property adjacent to the southwest in the 1957 aerial photograph, but drew no conclusions about these objects (Environ 1997).

Activities conducted at the Site by PEM included manufacturing specialty magnets, power supplies, and components, and repairing motors, generators, transformers, and magnets. A 2,000-gallon gasoline Underground Storage Tank was reportedly installed at the Site by PEM in 1975. In addition, the gasoline shed in the fueling area may have stored vehicle lubricants and oil for vehicle maintenance.

Following acquisition of the Site by Mo Dad Properties in 2001, the on-site buildings were occupied by Bay Area Powder Coatings. Bay Area Powder Coatings declared bankruptcy and ceased operations at the Site; however, some equipment belonging to this company was still present on the Site in 2005. No details are available as to the specific processes of Bay Area Powder Coatings.

In May 2008, CFC purchased the property. Landeros Iron Works ("Landeros"), which subleased the property, conducted its operations in and around the warehouse until December 2008. Landeros' operation was primarily welding and metal structure fabrication for door gates and windows. Landeros vacated the property in June 2009.

1.2 Soil Cleanup Goals

The results of previous investigations conducted at the Site indicated that soil and existing fill material at the Site had been primarily affected by TPHmo, TPHd, PCBs, SVOCs, arsenic, and lead. Cleanup goals were provided in the revised CAP and the cleanup goal for PCBs provided in the revised CAP was lowered from 0.370 milligram

per kilogram (mg/kg) to 0.130 mg/kg by the U.S. EPA to accommodate the potential cumulative risk of the other compounds at the Site. In addition, the cleanup goal for lead provided in the revised CAP was lowered from 255 mg/kg to 80 mg /kg to be consistent with the California Office of Environmental Health Hazard Assessment (OEHHA) 1 microgram per deciliter (µg/dL) benchmark for blood lead levels for protection of school children and fetuses (OEHHA 2009). In addition, the background concentration for arsenic was recalculated using the data collected across the Site.

1.2.1 Revised Arsenic Cleanup Goal

Some of the arsenic detected in soil samples collected at the Site can be attributed to background levels. However, some of the arsenic was found at concentrations greater than expected regional background concentrations. To estimate the difference between background and anthropogenic sources, ARCADIS statistically evaluated concentrations of arsenic to estimate a site-specific background concentration.

1.2.1.1 Statistical Approach Recommended by the DTSC

ARCADIS used one of the methods described in the Department of Toxic Substances Control (DTSC) document “Arsenic Strategies, Determination of Arsenic Remediation, Development of an Arsenic Cleanup Goal,” dated January 2009. Following the methodology presented in the document, log-transformed data (arsenic concentrations) are plotted against probability distribution that is expressed as standard deviation from the mean distribution. The probability of each data point is based on the rank order of the data and assumes the data is log-normally distributed. Best fit lines are drawn, based on the scatter plot. Each discernible line represents a distinct population.

The lower concentration population is assumed to represent background, and the early line slope change is assumed to represent the separation between background concentration and an anthropogenic concentration. If the background concentrations were to include all the data and fit a log-normal distribution, this line would plot as a straight line with no inflection point. Therefore, the inflection point indicates a change in the distribution of the data.

1.2.1.2 Statistical Evaluation of Arsenic Concentration at the Site

ARCADIS plotted the concentration measured in each in-place sample. The plot is presented in Appendix A. Two distinct lines can be observed in this plot. The point at which the lines intersect represents the change from background to anthropogenic

concentrations. This point of intersection is estimated to be approximately 9 mg/kg. Therefore, the arsenic concentration of 9.0 mg/kg represents an estimate of the naturally occurring background concentration. The in-place soils appear to have a slightly higher background concentration then the soils prior to excavation. The removal of the higher arsenic levels likely changed the slope of the graph when compared to the pre-removal data set.

As an alternative to preparing a formal risk assessment, soil data collected at the Site were directly compared to the cleanup goals and the need for remediation work was evaluated. The cleanup goals for soil at the Site were established for direct exposure pathways. The cleanup goals were reevaluated considering the possible post-development complete exposure pathways as described in the following table:

Cleanup Goals for Chemicals of Potential Concern In Soil
Former Pacific Electric Motors, Potential Aspire Charter School Site, 1009 66th Avenue, Oakland, California

Chemical of Potential Concern in Each Media	ESL Residential (direct exposure)	ESL Commercial (direct exposure)	DTSC-Approved Goal	Student Receptor Cleanup Goal	Recommended Cleanup Goal
Soil (mg/kg)					
TPH as gasoline	110	450	100	720	**450**
TPH as diesel	110	450	500	800	**450**
TPH as motor oil	370	3700	500	800	**800**
benzo(a)pyrene	0.038	0.13	0.05	0.21	**0.13**
benzo(a)anthracene	0.38	1.3	0.51	2.1	**1.3**
benzo(k)fluoranthene	0.38	1.3	0.51	2.1	**1.3**
chrysene	23	210	4.06	21	**21**
napthalene	1.3	2.8	4.06	21.0	**2.8**
benzene	0.12	0.27	4.96	4.5	**0.27**
arsenic	0.39	1.6	72	72	**9.0**
lead	260	750	255	255	**80**
chromium IV	9.4	360	174	174	**174**
PCBs	0.22	0.74	0.13	0.39	**0.13**

Note: ESL = Environmental Screening Level

1.3 Site Cleanup Plan Actions

As described in the revised CAP, to reduce the risks and/or the potential for human exposure to site soils, several remedial alternatives were considered with consideration

for the planned redevelopment of the Site as a charter school. The selected remedial alternative was excavation and off-site disposal, and land use restrictions. This alternative is deemed the most effective and results in the greatest reduction of long-term risks at the Site, provided short-term risks of exposure to workers and public are managed appropriately. This alternative involves the excavation of soils in targeted areas, which exceed the preliminary cleanup goals and off-site placement/disposal.

Because this Site contained PCB-affected soil at two locations greater than 50 mg/kg, the U.S. EPA was included to apply the TSCA for the PCB-affected soil. As such the removal action for the PCB-affected soil was documented in the letter report dated August 13, 2010.

The final extent of each excavation was determined by a combination of site-representative concentrations (95% upper confidence limit [UCL] of residual concentrations).

The original expected total volume of known affected soil to be excavated was approximately 1,250 in-place cubic yards. The results of the confirmation soil samples collected from excavation areas EXC1, EXC2, EXC4, PCB-EXC1, PCB-EXC2, PCB-EXC3, and PCB-EXC4 resulted in a significant increase in the volume of soil that was removed from the Site. In all a total of approximately 5,500 cubic yards (9,700 tons) of soil was removed from the Site.

The planned soil removal activities outlined in the revised CAP included the following tasks, which were all successfully completed:

- Obtaining necessary permits, such as a grading permit from the City of Oakland, and coverage under the construction general permit ("State Water Resources Control Board Order No. 99-08-DWQ, National Pollutant Discharge Elimination System (NPDES) General Permit No. CAS000002 Waste Discharge Requirements for Discharges of Storm Water Runoff Associated with Construction Activity").

- Preparing and implementing a Storm-Water Pollution Prevention Plan to comply with the grading permit.

- Preparing a site-specific health and safety plan (HASP).

- Mobilizing and establishing temporary facilities and main staging areas at the Site.

- Using site access and control measures to minimize the risk of exposure to contaminated soil materials and/or physical construction hazards, and to provide for a safe working environment for personnel.
- Conducting air monitoring in accordance with the HASP.
- Placing excavated soil in temporary stockpiles for waste characterization sampling.
- Conducting confirmation soil sampling following excavation to confirm that the cleanup goals had been achieved.
- Transporting and disposing of the excavated soil.

Descriptions of the implementation of the excavation tasks listed above are provided in Section 2 below.

2. Soil Removal Activities

This section describes the pre-excavation and excavation activities implemented by Aspire's excavation contractor, Innovative Construction Solutions – Norcal (ICS) between November 2009 and August 2010. ICS mobilized to perform the soil excavation and site demolition activities on November 4, 2009 and completed excavation activities on August 12, 2010.

2.1 Preparatory Activities

Prior to initiating the fieldwork, CFC selected an excavation contractor through a bidding-proposal process. Based on their review of the proposals, CFC retained ICS, a California-licensed contractor, to provide labor and equipment to conduct the removal action.

2.1.1 Health and Safety

All field activities were conducted in accordance with the site-specific HASPs prepared by ARCADIS and ICS. Each HASP addressed the health and safety hazards and included requirements and procedures for employee protection during work involving chemical-affected soil. The HASPs included the required elements per the Occupational Safety and Health Administration (OSHA) Hazardous Waste Operations and Emergency Response Standard (HAZWOPER) as set forth in Title 29, Code of

Federal Regulations, Part 1910.120. A copy of each contractor's HASP was kept on site during work performed by that contractor.

2.1.2 Notifications and Approvals

As requested by the ACDEH, a public notice was issued for residences and businesses located within the vicinity of the project Site, as well as to other stakeholders. In addition, ICS obtained a grading and a demolition permit from, and paid permit fees to, the City of Oakland Department of Public Works Department and coverage under the construction general permit ("State Water Resources Control Board Order No. 99-08-DWQ, NPDES No. CAS000002 Waste Discharge Requirements for Discharges of Storm Water Runoff Associated with Construction Activity").

2.1.3 Site Preparation, Access and Controls

ICS mobilized to the Site on November 4, 2009 and established temporary facilities (including sanitary facilities, refuse collection bins, and decontamination facilities) and main staging areas, and installed temporary construction fencing and signage around the excavation areas to inhibit unauthorized access at the Site.

Prior to commencing with the excavation activities, the areas to be excavated were located and marked with spray paint by representatives of ARCADIS based on site features and the analytical results (and locations) of previous soil samples. Representatives of ICS were also on site to assist and discuss the locations of the areas of excavation.

2.2 Excavation Activities

Excavation activities were conducted at the following seven individual areas described below and illustrated on Figure 2. These areas were identified in the revised CAP and were based on the analytical results of the soil samples collected at the Site.

- Two areas located in the former warehouse building designated as EXC-PCB1 and EXC-PCB2.

- Two areas located near 66th Avenue designated as EXC1 and EXC2. These two areas of excavation were expanded to the point where they became one large area of excavation as depicted on Figure 2.

- One large area in the northern portion of the Site designated as EXC4.
- Two other areas located within EXC4 designated EXC-PCB3 and EXC-PCB4.

ICS used conventional equipment such as excavators, backhoes, and loaders to complete the excavation. Excavation was completed between November 4, 2009 and August 2010 at the locations and depths indicated on Figures 3, 4, and 5. The final depth of excavation in these areas was approximately 3 to 8 feet below ground surface (bgs) depending on the analytical results of the confirmation soil samples.

In accordance with the cleanup criteria for the project, excavation proceeded until the confirmation soil samples were below the cleanup goal, or if the 95% UCL of the confirmation sample data for all areas of excavation was below the cleanup goal for each constituent of concern. The 95% UCL of the distribution mean was used as the representative concentration for screening purposes, and represents the exposure point concentration.

The EPA software ProUCL 4.00.05 was used to calculate both the statistical distribution and the associated 95% UCL for the distribution. Reporting limits were used as a proxy concentration for non-detections. Statistical distributions and 95% UCLs are presented in Section 3 of this report. As described below, PCB- and TPHmo-affected soils were left in place at concentrations greater than their respective cleanup goals. Soil containing concentrations of PCBs above the site cleanup goal could not be removed without compromising the integrity of the foundation for a neighboring building. Thus, this soil is to remain in place. The potential exposure pathway to the affected soil will be mitigated by the installation of the TSCA Cap that is to be installed across the entire Site. Details regarding the TSCA Cap were provided in the TSCA Report and the grading plan. In general the TSCA Cap will be comprised of the following:

- Asphalt areas that are subject to traffic – 6-inch-thick section of asphalt placed over a 6-inch-thick interval of imported and compacted aggregate base rock
- Asphalt areas that are subject to parking – 6-inch-thick section of asphalt placed over a 4-inch-thick interval of imported and compacted aggregate base rock
- Concrete slab that is for the multipurpose building – 6-inch-thick section of concrete placed over a 2-inch-thick interval of imported and compacted aggregate base rock

- Rat slabs beneath the modular buildings will be a 6-inch-thick section of asphalt

- Landscaped areas will be comprised of 12 inches of imported top soil placed on top of 10 inches of imported soil compacted to 90% relative compaction. In addition, a layer of orange plastic safety netting will be placed upon the native soil at the landscaped areas to demarcate the presence of native soil.

Areas of excavation were extended laterally and vertically where elevated concentrations of chemicals of concern were detected in the confirmation soil samples. The vertical extent was extended at 1-foot to 2-foot increments. In some cases, excavations extended to the underlying native soil layer (evident by the visual difference in the soil types/color). Confirmation samples were collected from the over-excavations at the same frequency as the initial confirmation sampling. Consequently, most of the excavation extended to approximately 3 to 4 feet bgs, with the maximum depth of excavation to approximately 6 feet bgs at portions of EXC-PCB1 and EXC-PCB4. Shoring was not required and groundwater was encountered at excavations EXC-PCB1, EXC-PCB2, and EXC4. The final areas of excavation are presented on Figures 3, 4, and 5.

2.2.1 Excavation Sampling and Analytical Testing

Confirmation soil samples were collected following the excavation of soil to confirm that the cleanup goals had been achieved. The samples were collected as discrete soil samples from the base of the excavation sidewalls with a spacing of approximately 20 to 25 linear feet, as specified in Section 8.16 of the revised CAP: *"Confirmation soil samples are not proposed to be collected from the base of the excavations. The redevelopment design plan for this Site includes completing the excavations with the placement of approximately 2 feet of clean fill overlain by asphalt paving and, in some places, asphalt paving and building structures."* However to comply with the request from U.S. EPA, confirmation soil samples were collected from the base of the excavations conducted for PCB-affected soil. In addition, soil samples collected from the base of the excavations conducted while removing the sewer lines were used as bottom samples for excavations EXC1 and EXC2 (see Figure 3).

Soil sampling equipment used at excavations EXC1, EXC2, and EXC4 was decontaminated with laboratory-grade soap and water between samples to minimize cross-contamination. Sampling equipment used at excavations EXC-PCB1, EXC-PCB2, EXC-PCB3, and EXC-PCB4 was decontaminated by swabbing the equipment

with towels containing hexane and then washing with laboratory-grade soap and water and rinsing with water between samples to minimize cross-contamination.

The soil samples were collected in 8-ounce jars provided by the analytical laboratory. The samples were delivered to TestAmerica Laboratories, Inc. ("TestAmerica") in Pleasanton, California, or Curtis & Tomkins, Ltd. (C&T) located in Berkeley, California for chemical analysis under chain-of-custody protocol. Both TestAmerica and C&T are California-certified analytical laboratories.

Samples were submitted to TestAmerica or C&T for the following analyses, depending on which excavation was being tested:

- Lead and arsenic EPA test method 6010
- TPHg, TPHd, and TPHmo EPA test method 8015, modified
- PCBs EPA test method 8081
- SVOCs EPA test method 8270
- VOCs EPA test method 8260

The Laboratory Certificates for the soil samples collected from these areas of excavation are provided in Appendix B (on CD). Please note that analytical results for some confirmation soil samples contained on the Laboratory Certificates are for soil samples that failed the cleanup criteria for lead and represent soil that was removed from the Site.

2.3 Excavations EXC1 and EXC2

Excavations EXC1 and EXC2 were conducted to remove lead-affected soil centered around two former catch basins (flat grate inlets) associated with the sewer system that were located near 66th Avenue (see Figures 2 and 3). However, the analytical results for confirmation soil samples collected at several locations from these excavations contained lead at concentrations greater than the cleanup goal for lead (80 mg/kg). As a result of these exceedances for lead, the size of these excavations expanded to the area depicted on Figures 2 and 3 (an area approximately 100 feet by 125 feet). Based on observations made at the time of the excavation the elevated concentrations of lead were associated with undocumented fill material that was previously imported to the

Site. The presence of wood, glass, metal, and brick in the upper 2 to 3 feet of soil indicated that this material could be representative of fill material. This material was excavated to a depth of approximately 3 feet bgs in the area depicted on Figures 2 and 3. The analytical results for the 27 confirmation soil samples collected from the final extent of excavation at excavations EXC1 and EXC2 are provided in Table 1 and on Figure 3.

2.3.1 Confirmation Sample Laboratory Results - Excavations EXC1 and EXC2

Excavation was performed until confirmation samples met the required 95% UCL for lead and arsenic at excavations EXC1 and EXC2. Soil containing concentrations of lead greater than the cleanup goal was left in place at four locations along the western portion of the area of excavations and one location along the eastern portion of the excavation (see Table 1 and Figure 3). However, this data was included in the 95% UCL calculation for lead in soil at the Site that indicated lead concentrations in the final confirmation samples are below the cleanup levels.

The potential exposure pathway to the lead-affected soil will be mitigated by the installation of the TSCA Cap that is to be installed across the Site. Details regarding the TSCA Cap were provided in the TSCA Report and the grading plan.

2.4 Excavations EXC-PCB1 and EXC-PCB2

Excavations EXC-PCB1and EXC-PCB2 were conducted to remove PCB-affected soil centered around two former catch basins (flat grate inlets) associated with the sewer system that were located inside the former warehouse building at the Site (see Figures 2 and 4). The analytical results for several confirmation soil samples collected from EXC-PCB1 and one confirmation soil sample collected from EXC-PCB2 contained PCBs at concentrations greater than the cleanup goal for PCBs (0.130 mg/kg). As a result of these exceedances for PCBs, the excavations were expanded to the area depicted on Figures 2 and 4. In addition, the depth of excavation for EXC-PCB1 was extended to approximately 6 feet bgs and the depth of the excavation for EXC-PCB2 was extended to approximately 4 feet bgs. Based on observations made at the time of the excavation, it appears as though the elevated concentrations of PCBs were associated with soil located around the former catch basins (flat grate inlets).

The analytical results for the 26 confirmation soil samples collected from the final extent of excavation at excavations EXC-PCB1 and the five samples collected from EXC-PCB2 are provided in Tables 2 and 3 and on Figure 4. Confirmation soil samples

collected from the western portion of EXC-PCB1 were analyzed for PCBs, TPHd, and TPHmo. However, based on the analytical results of the confirmation samples, it was clear that PCBs were the chemical of concern in this portion of the Site and thus the majority of the confirmation soil samples were analyzed for PCBs only.

2.4.1 Confirmation Sample Laboratory Results - Excavations EXC-PCB1 and EXC-PCB2

Soil excavation was performed until confirmation samples met the required 95% UCL. Soil containing concentrations of PCBs greater than the cleanup goal was left in place at one location at approximately 6 feet bgs at the base of EXC-PCB1 (see Table 2 and Figure 4). No soil containing concentrations of PCBs greater than the cleanup goal was left in place at EXC-PCB2 (see Table 3 and Figure 4).

2.5 Excavation EXC-PCB3

Excavation EXC-PCB3 was conducted to remove PCB-affected soil located near a topographic low area that received surface-water runoff in the northern portion of the Site (Figures 2 and 5). The analytical results for several confirmation soil samples collected from excavation EXC-PCB3 contained PCBs at concentrations greater than the cleanup goal for PCBs (0.130 mg/kg). As a result of these exceedances for PCBs, the size of this excavation was expanded to the area depicted on Figures 2 and 5. In addition, the depth of excavation for EXC-PCB3 was extended to approximately 4 feet bgs.

2.5.1 Confirmation Sample Laboratory Results - Excavation EXC-PCB3

A total of nine confirmation soil samples collected and analyzed from this area of excavation contained concentrations of PCBs below the cleanup criteria of 0.130 mg/kg (see Tables 4 and 5, and Figure 5). A total of three soil samples collected from this area contained PCBs above the cleanup criteria. Two of the soil samples that failed the cleanup criteria for PCBs were collected from along the property boundary adjacent to the large warehouse that is located on the adjacent property (Figure 5). As discussed, this area could not be excavated past 4 feet bgs due to the presence of the adjacent building; therefore, the soil had to be left in place.

Four confirmation soil samples were also analyzed for SVOCs. As indicated in Table 4, SVOCs were not detected above laboratory reporting limits in these four soil samples. Confirmation soil samples were also analyzed for fuel and fuel-related compounds. As indicated in Table 5, TPHg, and benzene, toluene, ethylbenzene, and total xylenes

(BTEX) were not detected above laboratory reporting limits. TPHd (one sample) and TPHmo were detected at concentrations above laboratory reporting limits but well below their cleanup criteria (see Table 5).

A total of five confirmation soil samples collected and analyzed from this area of excavation contained concentrations of arsenic below the cleanup criteria of 9 mg/kg (see Table 4 and Figure 5). A total of four soil samples collected from this area contained arsenic above the cleanup criteria. Similar to the lead-affected soil that remained in place at other areas of the Site, the potential exposure pathway to affected soil will be mitigated through the installation of a TSCA Cap.

2.6 Excavation EXC-PCB4

Excavation EXC-PCB4 was north of the topographic low area (PCB-EXC3; see Figures 3 and 5). The final depth of this area of excavation measured approximately 3 to 6 feet below grade. The analytical results for several confirmation soil samples collected from EXC-PCB4 contained PCBs at concentrations greater than the cleanup goal for PCBs (0.130 mg/kg). As a result of these exceedances for PCBs, the size of this excavation was expanded to the area depicted on Figures 2 and 5. In addition, the depth of excavation for EXC-PCB4 was extended to approximately 6 feet bgs.

2.6.1 Confirmation Sample Laboratory Results - Excavation EXC-PCB4

A total of seven confirmation soil samples were collected and analyzed from this area of excavation that met the cleanup criteria for PCBs (Table 6 and Figure 5). The analytical results for the samples collected from EXC-PCB4 are summarized in Table 6. One soil sample collected from this area contained PCBs above the cleanup criteria. Similar to the PCB-affected soil that remained in place at EXC-PCB3 and the lead-affected soil at excavations EXC1 and EXC2, the potential exposure pathway to this affected soil will be mitigated through the installation of a TSCA Cap.

2.7 Excavation EXC4

Excavation EXC4 encompassed a relatively large area at the northern portion of the Site (Figures 2 and 5). The chemicals of concern at this excavation were PCBs, arsenic, lead, SVOCs, VOCs, TPHg, TPHd, and TPHmo. Analytical results for confirmation soil samples collected from excavation EXC4 did not contain concentrations of TPHg, TPHd (except for one soil sample), SVOCs, VOCs, or lead above their respective cleanup goals (see Tables 7 and 8).

Analytical results for several confirmation soil samples collected from EXC4 contained PCBs, arsenic, and TPHmo at concentrations greater than their respective cleanup goals. As a result of these exceedances, the size of this excavation was expanded to the area depicted on Figures 2 and 5. Details regarding these exceedances of PCBs, arsenic, and TPHmo are provided below. The final depth of this area of excavation ranged from approximately 2 to 6 feet bgs.

2.7.1 Confirmation Sample Laboratory Results - Excavation EXC4 - PCBs

As discussed above, a total of four confirmation soil samples that were collected and analyzed from excavations EXC-PCB3 and EXC-PCB4 located from within excavation EXC4 contained PCBs at concentrations above the cleanup criteria for PCBs (Table 8 and Figure 5). In addition to these four soil samples, three other soil samples collected near the area that was excavated in 1992 contained PCBs at concentrations slightly above the cleanup criteria for PCBs (Table 8 and Figure 5). The potential exposure pathway to this affected soil will be mitigated through the installation of a TSCA Cap.

2.7.2 Confirmation Sample Laboratory Results - Excavation EXC4 - Arsenic

A total of eleven confirmation soil samples that were collected near the perimeter of excavation EXC4 contained arsenic at concentrations slightly above the revised cleanup criteria (background concentration) of 9.0 mg/kg for arsenic (Table 8 and Figure 5). These concentrations of arsenic ranged from 9.2 mg/kg to 27 mg/kg. Seven of the nine soil samples that contained concentrations of arsenic exceeding the cleanup criteria for arsenic contained between 14 mg/kg and 9.2 mg/kg. The two samples that contained the highest concentrations of arsenic that will remain on site are 30 and 27 mg/kg. The potential exposure pathway to this arsenic-affected soil will be mitigated through the installation of a TSCA Cap over the affected soil.

2.7.3 Confirmation Sample Laboratory Results - Excavation EXC4 - TPHmo

A total of three confirmation soil samples that were collected near the perimeter of excavation EXC4 contained TPHmo at concentrations above the cleanup criteria of 450 mg/kg (Table 7 and Figure 5). These concentrations of TPHmo ranged from 2,400 mg/kg to 3,100 mg/kg. The potential exposure pathway to this TPHmo-affected soil will be mitigated through the installation of a TSCA Cap over the affected soil.

3. In-Place Soil Evaluation

As provided in the TSCA Report, a human health risk screen was performed considering the soil that was left in place after the removal actions. This included analytical data for soil samples collected during the site characterization activities and post-removal confirmation soil sampling events. Data associated with soil that was removed from the Site (i.e. excavated, transported, and disposed of off site) were removed from the data set. Therefore, the data set consists of only data associated with soils remaining on site.

Exposure point concentrations (EPCs) of the post-removal chemicals of concern (COCS) were used to perform the human health risk screen. The EPCs for the selected COCs were compared to Recommended Cleanup Goals presented in the revised CAP (LFR 2009b). The U.S. EPA software ProUCL Version 4.00.05 was used to perform the statistical evaluation. EPCs were calculated for COCs with a minimum of six detections. Maximum detected concentrations were used for COCs with fewer than six detections.

Details on the statistical evaluation and representative concentrations are included in Appendix A of the TSCA Report.

3.1 Health Risk Screen

Comparisons were performed as follows for carcinogenic compounds:

$$\text{Risk}_{EPC} = \frac{\text{EPCsoil x TRisk}}{\text{CUG}}$$

Where:

RiskEPC = estimated risk for COC (target = 10-6)
EPCsoil = exposure point concentration for soil
TRisk = target risk used for the CUP calculation (10-6)
CUP = cleanup goal presented for the COCs in CAP

Comparisons were performed as follows for non-carcinogenic compounds:

$$\text{HazardEPC} = \frac{\text{EPCsoil}}{\text{CUG}}$$

Where:

HazardEPC = estimated risk for Site (target = 1)
EPCsoil = exposure point concentration for soil
CUP = cleanup goal presented for the COCs in CAP

The estimated risk based on the screen is 2×10^{-6}. PCBs are the only in-place COCs with an estimated risk greater than 1×10^{-6}. The estimated Hazard Index (HI) is 4. PCBs are the only in-place COCs with an estimated HI greater than 1.

The metals arsenic and lead were evaluated by comparing their respective EPCs to the established cleanup goals. Arsenic's goal is based on naturally occurring background concentrations, and lead is based on the residential California Human Health Screening Level (OEHHA 2009). Both arsenic and lead EPCs were below their respective screening criteria.

Summary of Post-Excavation Representative Concentrations Screen

Chemical of Potential Concern	Distribution	Cleanup Goal	Post-Removal Action Representative Concentration
TPHd	Non-Parametric	450	138
TPHmo	Non-Parametric	800	**894.5**
Benzo(a)pyrene	--	0.13	NA
Benzo(a)anthracene	--	1.3	NA
Benzo(k)fluoranthene*	NA	1.3	0.11
Chrysene*	NA	21	0.19
Naphthalene	--	2.8	NA
Benzene*	NA	0.27	0.012
Arsenic	Gamma	7 or 9	8.8
Lead	Gamma	80	62
PCBs	Non-Parametric	0.13	**0.27**

Notes:

* Fewer than 6 detections; maximum concentration used for representative concentration

NA = not applicable, no detections above analytical reporting limits

Bold = compounds that exceeded the 95% UCL after remedial activities were completed

-- = no detection above analytical reporting limits, statistical distribution cannot be calculated

The representative concentrations for each of the chemicals of concern other than PCBs and TPHmo are below their respective screening criteria. The screening criteria are based on protection of human health, or for arsenic, background concentration. The potential human health risks associated with the presence of PCBs or TPHmo will be mitigated by the installation of the TSCA Cap. Thus the proposed redevelopment of the Site can occur without additional mitigation for PCBs or TPHmo.

3.1.1 Soil Staging and Disposal

The excavated soil from the Site was staged on site in stockpiles pending characterization for disposal; soil from excavation EXC-PCB1 and the area near the excavation that took place in 1992 (within excavation EXC4) were combined. This soil was transported and disposed of as PCB Remediation Waste at Waste Management's Kettleman Hills Landfill. The soil from excavations EXC-PCB2, EXC-PCB3, EXC-PCB4, and EXC4 were transported and disposed of at Republic Services Keller Canyon Landfill located in Pittsburg, California. Due to elevated lead soluble threshold limit concentration (STLC) results in samples from the combined excavation EXC1 and

EXC2, this soil was characterized as non-Resource Conservation and Recovery Act (RCRA) solid hazardous waste and transported for disposal at Waste Management's Kettleman Hills Landfill. Copies of the waste manifests are included in Appendix C.

3.1.2 Excavation Backfill

Excavations EXC4, EXC-PCB3, and EXC-PCB4 have not been backfilled to date. These excavations will be backfilled using on-site soil as part of site construction activities that are scheduled to begin in October 2010. Combined excavations EXC1 and EXC2, EXC-PCB1 and EXC-PCB2 were backfilled. The source of the soil used as backfill was the athletic complex construction site at the University of California at Berkeley. Laboratory reports for soil samples collected from this soil are included in Appendix B (on CD).

3.1.3 Dust Control and Air Monitoring

Dust control measures were implemented to limit dust migration from the work areas. Temporary excavated soil stockpiles were covered with plastic sheeting at the end of the work day. Water mist/spray application was employed during all excavation and soil handling activities including loading onto trucks and backfilling. The water application rate was regulated to avoid over-wetting and generating sediment-laden runoff. Vehicle/equipment haul routes were also sprayed periodically to minimize dust generation. Mud/dirt from the work areas that accumulated on the adjacent streets was removed at least daily.

The air monitoring program was included in the revised CAP. The objectives of the air monitoring plan were to collect scientifically valid data using standard industrial hygiene practices to provide information on particulate emissions resulting from the removal activities, and to provide real-time data that could be used to modify work practices, as necessary. These data were used to evaluate whether the dust control programs performed effectively and, if necessary, to provide a basis for modifying work practices (e.g., increase frequency of dust control measures).

The total dust action limit of 2.5 milligrams per cubic meter (mg/m^3) was established using one half the California OSHA permissible exposure limit for respirable dust. Real-time total dust data collected are retained in the project files.

Analytical results of the air monitoring samples collected at the Site are provided in Table 9.

4. Summary

The removal action summarized in this report was conducted in accordance with the revised CAP (LFR 2009b). The fuel-affected groundwater at the Site is being remediated by an AS-SVE system. The AS-SVE system is currently operating and the operation, maintenance, and monitoring of this system is being reported to the ACDEH on a quarterly basis in conjunction with the groundwater monitoring plan for the Site. The evaluation and assessment for closure of the groundwater remediation will continue under the groundwater monitoring plan for the Site.

Between November 2009 and August 2010, soil excavation activities were completed at the Site. This work resulted in the removal of approximately 8,900 tons of affected soil from the Site that was transported to either Waste Management's Kettleman Hills Class I Landfill located in Kettleman City, California or Republic Waste's Vasco Road Class II Landfill located in Livermore, California.

To ensure that the removal activities successfully met the cleanup goals, the 95% UCL of the confirmation soil sample data was calculated for each COC and compared with the respective cleanup goal. The results of this analysis indicated that concentrations of TPHmo and PCBs remained in soil at the Site at concentrations greater than the cleanup goals. The potential human health risks associated with the presence of PCBs or TPHmo will be mitigated by the installation of the TSCA Cap. Thus, the proposed redevelopment of the Site can occur without additional mitigation for TPHmo or PCBs and no further action is recommended for the Site.

Notes:
* PDR was reading high. Compared to another PDR in same location to test and found that PDR was providing invalid data.
Samples analyzed by EMSL Analytical, Inc., a state-certified laboratory located in San Leandro, California.
Samples analyzed using transmission electron microscopy, selected area electron diffraction, and energy dispersive X-
mg/m^3 = milligrams per cubic meter
NA = Not applicable
ND = None detected
L/m = Liters of air per minute
TWA = time-weighted average
Wind speed and wind direction were measured with an on-site meteorological station.
Not Working = Instrument failure
PDR value questionable
PCB = polychlorinated biphenyl
As/Pb = arsenic/lead
BTEX = benzene, toluene, ethylbenzene, and total xylenes
